| 15:14 | VTIR | VLAN Tag Insertion or Replacement: These bits request the MAC to perform VLAN tagging or untagging before transmitting the packets. The application must set the CRC Pad Control bits appropriately when VLAN tag insertion, replacement, or deletion is enabled for the packet. The values of these bits are as follows: 00: Do not add a VLAN tag. 01: Remove the VLAN tag from the packets before transmission. This option should be used only with the VLAN packets. 10: Insert a VLAN tag with the tag value programmed in the <i>VLAN inclusion register (ETH_MACVIR)</i> or context descriptor. 11: Replace the VLAN tag in packets with the tag value programmed in the <i>VLAN inclusion register (ETH_MACVIR)</i> or context descriptor. This option should be used only with the VLAN packets. |

Table 560. TDES2 normal descriptor (read format) (continued)

| Bits | Name | Description |
|------|-----------|---|
| 13:0 | HL or B1L | <p>Header length or buffer 1 length For Header length, only bits [9:0] are taken into account. Bits 13 to 0 are applicable only to buffer 1 length. If the TCP Segmentation Offload feature is enabled through the TSE bit of TDES3, this field is equal to the header length. When the TSE bit is set in TDES3, the header length includes the length (expressed in bytes) from Ethernet Source address till the end of the TCP header. The maximum header length supported for TSO feature is 1023 bytes. If the TCP Segmentation Offload feature is not enabled, this field is equal to Buffer 1 length.</p> |

- TDES3 normal descriptor (read format)

Table 561. TDES3 normal descriptor (read format)

| Bits | Name | Description |
|------|------|---|
| 31 | OWN | <p>Own bit 1: the DMA owns the descriptor. 0: the application owns the descriptor. The DMA clears this bit after it completes the transfer of data given in the associated buffer(s).</p> |
| 30 | CTXT | <p>Context Type This bit should be set to 0 for normal descriptor.</p> |
| 29 | FD | <p>First Descriptor When this bit is set, it indicates that the buffer contains the first segment of a packet.</p> |
| 28 | LD | <p>Last Descriptor When this bit is set, it indicates that the buffer contains the last segment of the packet. B1L or B2L field should have a non-zero value.</p> |

Table 561. TDES3 normal descriptor (read format) (continued)

| Bits | Name | Description |
|-------|------|--|
| 27:26 | CPC | <p>CRC Pad Control</p> <p>This field controls the CRC and Pad Insertion for Tx packet. It is valid only when the first descriptor bit (TDES3[29]) is set. The values of bits[27:26] are the following:</p> <p>00: CRC and Pad Insertion The MAC appends the cyclic redundancy check (CRC) at the end of the transmitted packets whose length greater than or equal to 60 bytes. The MAC automatically appends padding and CRC to a packet with length less than 60 bytes.</p> <p>01: CRC Insertion (Disable Pad Insertion) The MAC appends the CRC at the end of the transmitted packet but it does not append padding. The application should ensure that the padding bytes are present in the packet being transferred from the Transmit buffer, that is, the packet being transferred from the Transmit Buffer is of length greater than or equal to 60 bytes.</p> <p>10: Disable CRC Insertion The MAC does not append the CRC at the end of the transmitted packet. The application should ensure that the padding and CRC bytes are present in the packet being transferred from the Transmit Buffer.</p> <p>11: CRC Replacement The MAC replaces the last four bytes of the transmitted packet with recalculated CRC bytes. The application should ensure that the padding and CRC bytes are present in the packet being transferred from the Transmit Buffer.</p> <p>When the TSE bit is set, the MAC ignores this field because the CRC and pad insertion is always done for segmentation.</p> |
| 25:23 | SAIC | <p>SA Insertion Control</p> <p>These bits request the MAC to add or replace the Source Address field in the Ethernet packet with the value given in the MAC Address 0 register. The application must appropriately set the CRC Pad Control bits when SA Insertion Control is enabled for the packet.</p> <p>Bit 25 specifies the MAC Address Register (1 or 0) value that is used for Source Address insertion or replacement.</p> <p>The following list describes the values of Bits[24:23]:</p> <p>00: Do not include the source address 01: Include or insert the source address. For reliable transmission, the application must provide frames without source addresses. 10: Replace the source address. For reliable transmission, the application must provide frames with source addresses. 11: Reserved</p> <p>These bits are valid when the First Segment control bit (TDES3 [29]) is set.</p> |
| 22:19 | THL | <p>THL: TCP Header Length</p> <p>If the TSE bit is set, this field contains the length of the TCP/UDP header. The minimum value of this field must be 5 for TCP header. THL value must be equal to 2 for UDP header. This field is valid only for the first descriptor.</p> |
| 18 | TSE | <p>TCP Segmentation Enable</p> <p>When this bit is set, the DMA performs the TCP/UDP segmentation for a packet. This bit is valid only if the FD bit is set.</p> |

Table 561. TDES3 normal descriptor (read format) (continued)

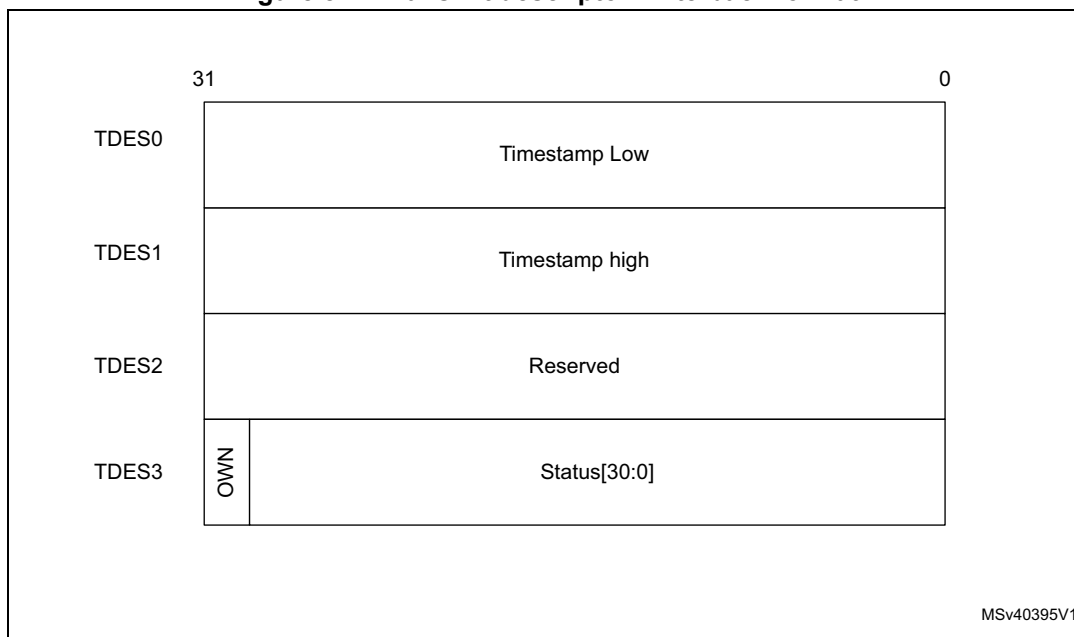

| Bits | Name | Description |
|-------|---------|--|
| 17:16 | CIC/TPL | <p>Checksum Insertion Control or TCP Payload Length These bits control the checksum calculation and insertion. They can take the following values: 00: Checksum insertion disabled. 01: Only IP header checksum calculation and insertion are enabled. 10: IP header checksum and payload checksum calculation and insertion are enabled, but pseudo-header checksum is not calculated in hardware. 11: IP header checksum and payload checksum calculation and insertion are enabled, and pseudo-header checksum is calculated in hardware. This field is valid when the TSE bit is reset. When the TSE bit is set, it contains the upper bits [17:16] of the TCP Payload length. This allows the TCP packet length field to be spanned across TDES3[17:0] to provide 256 Kbyte packet length support.</p> |
| 15 | TPL | <p>Reserved or TCP Payload Length When the TSE bit is reset, this bit is reserved. When the TSE bit is set, this is bit 15 of the TCP payload length [17:0].</p> |
| 14:0 | FL/TPL | <p>Reserved or TCP Payload Length When the TSE bit is set, this field is equal to the lower 15 bits of the TCP payload length. This length does not include Ethernet header or TCP/UDP/IP header length. When the TSE bit is reset, this bit is reserved.</p> |

Transmit normal descriptor (write-back format)

The write-back format is applicable only for the last descriptor of the corresponding packet. The LD bit (TDES3[28]) is set in the descriptor where the DMA writes back the status and timestamp information for the corresponding Transmit packet.

Figure 811 shows the write-back format for Transmit normal descriptors. *Table 562* to *Table 565* provide a detailed description of all Transmit Normal descriptors (Write-Back Format).

Figure 811. Transmit descriptor write-back format

MSv40395V1

- TDES0 normal descriptor (write-back format)

Table 562. TDES0 normal descriptor (write-back format)⁽¹⁾

| Bit | Name | Description |
|------|------|---|
| 31:0 | TTSL | Transmit Packet Timestamp Low The DMA updates this field with least significant 32 bits of the timestamp captured for the corresponding Transmit packet. The DMA writes the timestamp only if TTSE bit of TDES2 is set in the first descriptor of the packet. This field holds the timestamp only if the Last Segment bit (LS) in the descriptor is set and the Timestamp status (TTSS) bit is set. |

1. This format is only applicable to the last descriptor of a packet.

- TDES1 normal descriptor (write-back format)

Table 563. TDES1 normal descriptor (write-back format)⁽¹⁾

| Bit | Name | Description |
|------|------|--|
| 31:0 | TTSH | Transmit Packet Timestamp High The DMA updates this field with the most significant 32 bits of the timestamp captured for corresponding Receive packet. The DMA writes the timestamp only if the TTSE bit of TDES2 is set in the first descriptor of the packet. This field has the timestamp only if the Last Segment bit (LS) in the descriptor is set and Timestamp status (TTSS) bit is set. |

1. This format is only applicable to the last descriptor of a packet.

- TDES2 normal descriptor (write-back format)

Table 564. TDES2 normal descriptor (write-back format)⁽¹⁾

| Bit | Description |
|------|-------------|
| 31:0 | Reserved |

1. This format is only applicable to the last descriptor of a packet.

Table 565. TDES3 normal descriptor (write-back format)⁽¹⁾

| Bit | Name | Description |
|-------|----------|---|
| 31 | OWN | Own bit When this bit is set, it indicates that the DMA owns the descriptor. The DMA clears this bit when it completes the packet transmission. After the write-back is complete, this bit is set to 0. |
| 30 | CTXT | Context Type This bit should be set to 0 for normal descriptors. |
| 29 | FD | First Descriptor This bit indicates that the buffer contains the first segment of a packet. |
| 28 | LD | Last Descriptor This bit is set 1 for last descriptor of a packet. The DMA writes the status fields only in the last descriptor of the packet. |
| 27:18 | Reserved | |
| 17 | TTSS | Tx Timestamp Status This status bit indicates that a timestamp has been captured for the corresponding transmit packet. When this bit is set, TDES0 and TDES1 have timestamp values that were captured for the Transmit packet. This field is valid only when the Last Segment control bit (TDES3 [28]) in a descriptor is set. |
| 16 | Reserved | |

Table 565. TDES3 normal descriptor (write-back format)⁽¹⁾ (continued)

| Bit | Name | Description |
|-----|------|---|
| 15 | ES | <p>Error Summary</p> <p>This bit indicates the logical OR of the following bits:</p> <ul style="list-style-type: none"> TDES3[0]: IP Header Error TDES3[14]: Jabber Timeout TDES3[13]: Packet Flush TDES3[12]: Payload Checksum Error TDES3[11]: Loss of Carrier TDES3[10]: No Carrier TDES3[9]: Late Collision TDES3[8]: Excessive Collision TDES3[3]: Excessive Deferral TDES3[2]: Underflow Error |
| 14 | JT | <p>Jabber Timeout</p> <p>This bit indicates that the MAC transmitter has experienced a jabber timeout. This bit is set only when the JD bit of the <i>Operating mode configuration register (ETH_MACCCR)</i> is not set.</p> |
| 13 | FF | <p>Packet Flushed</p> <p>This bit indicates that the DMA or MTL flushed the packet because of a software flush command given by the CPU.</p> |
| 12 | PCE | <p>Payload Checksum Error</p> <p>This bit indicates that the Checksum Offload engine had a failure and did not insert any checksum into the encapsulated TCP, UDP, or ICMP payload. This failure can be either caused by insufficient bytes, as indicated by the Payload Length field of the IP Header, or by the MTL starting to forward the packet to the MAC transmitter in Store-and-Forward mode without the checksum having been calculated yet. This second error condition only occurs when the Transmit FIFO depth is less than the length of the Ethernet packet being transmitted to avoid deadlock, the MTL starts forwarding the packet when the FIFO is full, even in the store-and-forward mode. This error can also occur when a Bus error is detected during packet transfer.</p> |
| 11 | LoC | <p>Loss of Carrier</p> <p>This bit indicates that Loss of Carrier occurred during packet transmission (that is, the ETH_CRS signal was inactive for one or more transmit clock periods during packet transmission). This is valid only for the packets transmitted without collision and when the MAC operates in the Half-duplex mode.</p> |
| 10 | NC | <p>No Carrier</p> <p>This bit indicates that the carrier sense signal from the PHY was not asserted during transmission.</p> |
| 9 | LC | <p>Late Collision</p> <p>This bit indicates that packet transmission was aborted because a collision occurred after the collision window (64 byte times including Preamble in MII mode). This bit is not valid if Underflow Error is set.</p> |

Table 565. TDES3 normal descriptor (write-back format)⁽¹⁾ (continued)

| Bit | Name | Description |
|-----|------|--|
| 8 | EC | Excessive Collision This bit indicates that the transmission was aborted after 16 successive collisions while attempting to transmit the current packet. If the DR bit is set in the <i>Operating mode configuration register (ETH_MACCCR)</i> , this bit is set after first collision and the transmission of the packet is aborted. |
| 7:4 | CC | Collision Count This 4-bit counter value indicates the number of collisions occurred before the packet was transmitted. The count is not valid when the EC bit is set. |
| 3 | ED | Excessive Deferral This bit indicates that the transmission ended because of excessive deferral of over 24,288 bit times if DC bit is set in the <i>Operating mode configuration register (ETH_MACCCR)</i> . |
| 2 | UF | Underflow Error This bit indicates that the MAC aborted the packet because the data arrived late from the system memory. The underflow error can occur because of either of the following conditions: The DMA encountered an empty Transmit Buffer while transmitting the packet The application filled the MTL Tx FIFO slower than the MAC transmit rate The transmission process enters the Suspend state and sets the underflow bit corresponding to a queue in the ETH_MTLISR register. |
| 1 | DB | Deferred Bit This bit indicates that the MAC deferred before transmitting because of presence of carrier. This bit is valid only in the Half-duplex mode. |
| 0 | IHE | IP Header Error When IP Header Error is set, this bit indicates that the Checksum Offload engine detected an IP header error. If COE detects an IP header error, it still inserts an IPv4 header checksum if the Ethernet Type field indicates an IPv4 payload. |

1. This format is only applicable to the last descriptor of a packet.

Transmit context descriptor

The Transmit context descriptor can be provided any time before a packet descriptor. The context is valid for the current packet and subsequent packets. The context descriptor is used to provide the timestamps for one-step timestamp correction, and VLAN Tag ID for VLAN insertion feature. Write-back is only done on a context descriptor to reset the OWN bit.

Note: The VLAN tag IDs and MSS values, which are provided by the application in a context descriptor with their corresponding Valid bits set, are stored internally by the DMA.

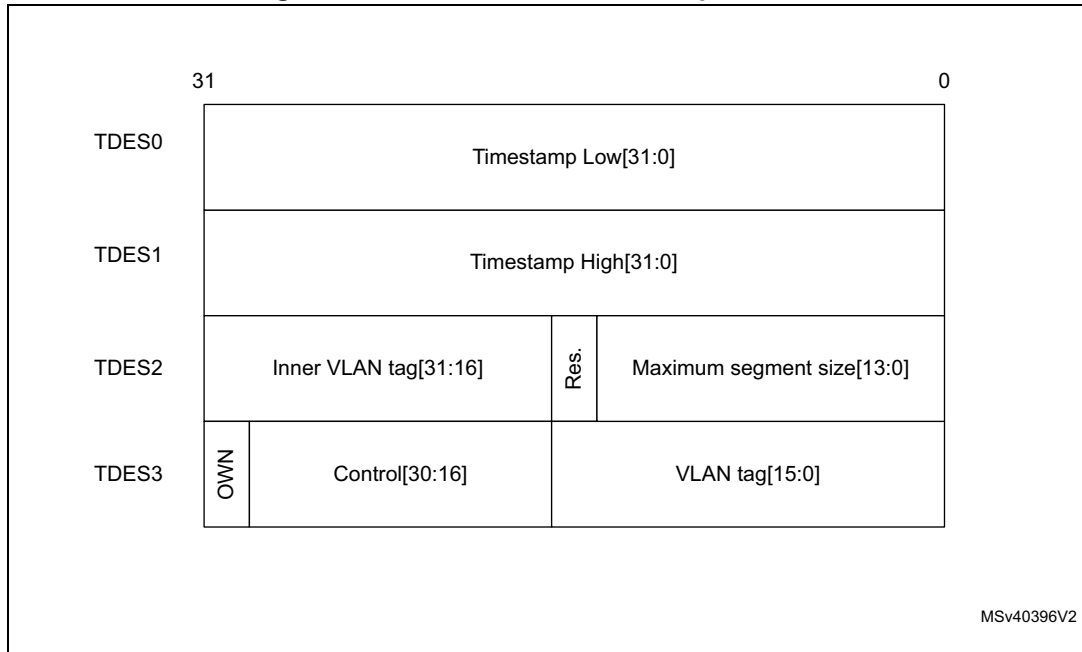

When the outer or inner VLAN tag is provided with the Valid bit set, the DMA always passes the last valid VLAN tag to the MTL. The application cannot invalidate the valid VLAN tag

stored by the DMA. The VLAN tag is inserted or replaced based on the control inputs provided for the packet.

The Inner VLAN Tag Control input is used only for the packet that immediately follows the context descriptor. The application must provide a context descriptor before the normal descriptor of each packet for which the DMA should use the inner VLAN Tag control input.

Figure 812 shows the format for Transmit context descriptors. Table 566 to Table 569 provide a detailed description of all Transmit context descriptors.

Figure 812. Transmit context descriptor format

- TDES0 context descriptor (read format)

Table 566. TDES0 context descriptor

| Bit | Name | Description |
|------|------|---|
| 31:0 | TTSL | <p>Transmit Packet Timestamp Low</p> <p>For one-step correction, the driver can provide the lower 32 bits of timestamp in this descriptor word. The DMA uses this value as the low word for doing one-step timestamp correction. This field is valid only if the OSTC and TCMSSV bits of TDES3 context descriptor are set.</p> |

- TDES1 context descriptor (read format)

Table 567. TDES1 context descriptor

| Bit | Name | Description |
|------|------|---|
| 31:0 | TTSH | Transmit Packet Timestamp High For one-step correction, the driver can provide the upper 32 bits of timestamp in this descriptor. The DMA uses this value as the high word for doing one-step timestamp correction. This field is valid only if the OSTC and TCMSSV bits of TDES3 context descriptor are set. |

- TDES2 context descriptor (read format)

Table 568. TDES2 context descriptor

| Bit | Name | Description |
|-------|----------|--|
| 31:16 | IVT | Inner VLAN Tag When the IVLTV bit of TDES3 context descriptor is set and the TCMSSV and OSTC bits of TDES3 context descriptor are reset, TDES2[31:16] contains the inner VLAN Tag to be inserted in the subsequent Transmit packets. |
| 15:14 | Reserved | |
| 13:0 | MSS | Maximum Segment Size This segment size is used while segmenting the TCP/IP payload. This field is valid only if the TCMSSV bit of TDES3 context descriptor is set and the OSTC bit of the TDES3 context descriptor is reset. |

- TDES3 context descriptor (read format)

Table 569. TDES3 context descriptor

| Bit | Name | Description |
|-------|----------|---|
| 31 | OWN | Own bit 1: the DMA owns the descriptor. 0: the application owns the descriptor. The DMA clears this bit immediately after a read operation. |
| 30 | CTXT | Context Type This bit should be set to 1 for context descriptor. |
| 29:28 | Reserved | |
| 27 | OSTC | One-Step Timestamp Correction Enable When this bit is set, the DMA performs a one-step timestamp correction with reference to the timestamp values provided in TDES0 and TDES1. |

Table 569. TDES3 context descriptor (continued)

| Bit | Name | Description |
|-------|--------|---|
| 26 | TCMSSV | <p>One-Step Timestamp Correction Input or MSS Valid When this bit and the OSTC bit are set, it indicates that the Timestamp Correction input provided in TDES0 and TDES1 is valid. When the OSTC bit is reset and this bit and the TSE bit of TDES3 are set in subsequent normal descriptor, it indicates that the MSS input in TDES2 is valid.</p> |
| 25:24 | | Reserved |
| 23 | CDE | <p>Context Descriptor Error When this bit is set, it indicates that the context descriptor is incorrect. The DMA sets this bit during write-back while closing the context descriptor. The Context Descriptor errors can be: – Incorrect sequence from the context descriptor. For example, a location before the first descriptor for a packet. – All 1s. – CD, LD, and FD bits set to 1. <i>Note: When a Context Descriptor error occurs due to All 1s or CTXT, LD, and FD bits set to 1, the Transmit DMA closes the transmit descriptor with DE and LD bits set to 1. When IOC bit in TDES2 of corresponding first descriptor is set to 1, Transmit DMA sets the TI bit in the Channel status register (ETH_DMACSR). Based on CTXT, LD, and FD bits of the transmit descriptor, the subsequent descriptor might be considered as the First Descriptor (even if FD bit is not set) and partial packet is sent. This error is categorized as an abnormal event; recovery is only by issuing a software reset (DMA stopping-reconfiguring-restarting recovery mechanism is not supported)</i></p> |
| 22:20 | | Reserved |
| 19:18 | IVTIR | <p>Inner VLAN Tag Insert or Replace When these bits are set, they request the MAC to perform Inner VLAN tagging or untagging before transmitting the packets. If the packet is modified for VLAN tags, the MAC automatically recalculates and replaces the CRC bytes. This bitfield has the following values: 00: Do not add the inner VLAN tag. 01: Remove the inner VLAN tag from the packets before transmission. This option should be used only with the VLAN frames. 10: Insert an inner VLAN tag with the tag value programmed in the Inner VLAN inclusion register (ETH_MACIVIR) or context descriptor. 11: Replace the inner VLAN tag in packets with the tag value programmed in the Inner VLAN inclusion register (ETH_MACIVIR) or context descriptor. This option should be used only with the VLAN frames.</p> |
| 17 | IVLTV | <p>Inner VLAN Tag Valid When this bit is set, it indicates that the IVT field of TDES2 is valid.</p> |

Table 569. TDES3 context descriptor (continued)

| Bit | Name | Description |
|------|------|--|
| 16 | VLTV | VLAN Tag Valid When this bit is set, it indicates that the VT field of TDES3 is valid. |
| 15:0 | VT | VLAN Tag This field contains the VLAN Tag to be inserted or replaced in the packet. This field is used as VLAN Tag only when the VLTI bit of the VLAN inclusion register (ETH_MACVIR) is reset. |

58.10.4 Receive descriptor

The DMA in the Ethernet peripheral attempts to read a descriptor only if the Tail pointer is different from the Base pointer or current pointer. It is recommended to have a descriptor ring with a length that can accommodate at least two complete packets received by the MAC; otherwise, the performance of the DMA is greatly impacted because of the unavailability of the descriptors. In such a situation, the MTL RxFIFO becomes full and starts dropping packets.

The following Receive descriptors are present:

- Normal descriptors with read and write-back formats
- Context descriptors

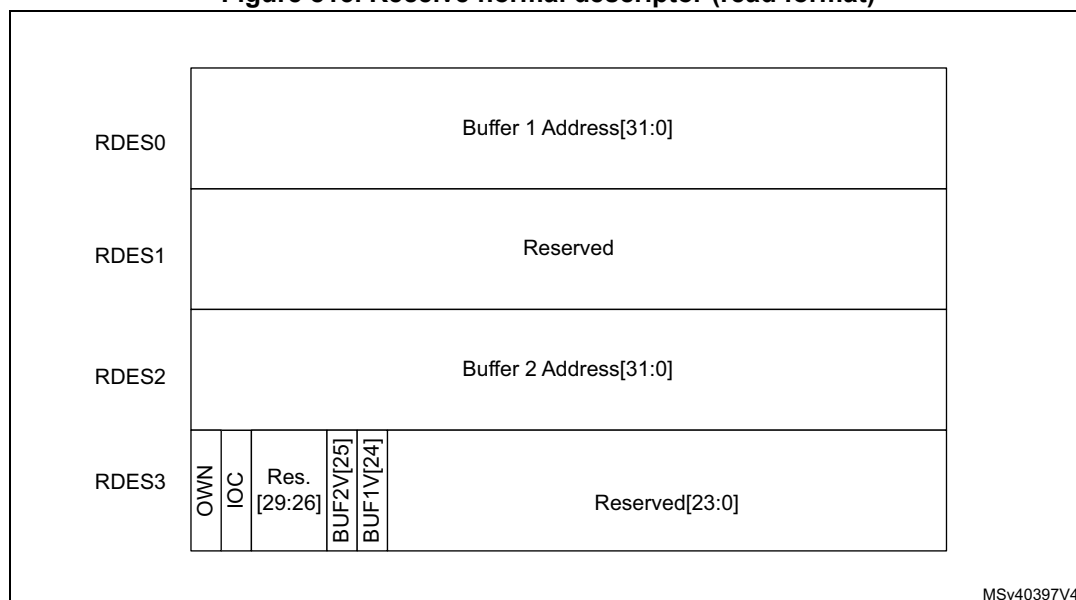

All received descriptors are prepared by the software and given to the DMA as “normal” descriptors (see [Figure 813: Receive normal descriptor \(read format\)](#) for a description of their content). The DMA reads this descriptor and, after transferring a received packet (or part of it) to the buffers indicated by the descriptor, the Rx DMA closes the descriptor with the corresponding packet status. The status format is given in [Figure 814: Receive normal descriptor \(write-back format\)](#).

For some packets, the normal descriptor bits are not sufficient to write the complete status. For such packets, the Rx DMA writes the extended status to the next descriptor (without processing or using the Buffers pointers embedded in that descriptor). The format and content of this write-back descriptor is described in [Figure 815: Receive context descriptor](#).

Receive normal descriptor (read format)

[Figure 813](#) shows the read format for Receive normal descriptors. [Table 570](#) to [Table 573](#) provide a detailed description of all Receive normal descriptors (read format).

Figure 813. Receive normal descriptor (read format)

Note: In the Receive descriptor (read format), if the Buffer Address field contains only 0s, the MAC does not transfer data to this buffer and skips to the next buffer or next descriptor.

- RDES0 normal descriptor (read format)

Table 570. RDES0 normal descriptor (read format)

| Bit | Name | Description |
|------|--------|---|
| 31:0 | BUF1AP | <p>Buffer 1 Address Pointer</p> <p>These bits indicate the physical address of Buffer 1. The application can program a byte-aligned address for this buffer, which means that the LS bits of this field can be non-zero. However, while transferring the start of packet, the DMA performs a write operation with RDES2[1:0]=0 in case of 64-/128-bit configuration) as zero. However, the packet data is shifted by the actual offset as given in the buffer address pointer. If the address pointer points to a buffer where the middle or last part of the packet is stored, the DMA ignores the offset address and writes to the full location as indicated by the data-width.</p> |

- RDES1 normal descriptor (read format)

Table 571. RDES1 normal descriptor (read format)

| Bit | Name | Description |
|------|----------|-----------------|
| 31:0 | Reserved | Field reserved. |

- RDES2 normal descriptor (read format)

Table 572. RDES2 normal descriptor (read format)

| Bit | Name | Description |
|------|--------|---|
| 31:0 | BUF2AP | <p>Buffer 2 Address Pointer</p> <p>These bits indicate Buffer 2 physical address. The RxDMA uses the LS bits of the pointer address only while transferring the start bytes of a packet. If the BUF2AP is giving the address of a buffer in which the middle or last part of a packet is stored, the DMA ignores RDES2[1:0]=0 and writes to the complete location.</p> |

- RDES3 normal descriptor (read format)

| | | | | | | | | | | | | | | | |

Table 575. RDES1 normal descriptor (write-back format)⁽¹⁾ (continued)

| Bit | Name | Description |
|-----|------|--|
| 6 | IPCB | IP Checksum Bypassed This bit indicates that the checksum offload engine is bypassed. |
| 5 | IPV6 | IPv6 header Present This bit indicates that an IPV6 header is detected. |
| 4 | IPV4 | IPv4 Header Present This bit indicates that an IPV4 header is detected. |
| 3 | IPHE | IP Header Error – When this bit is set, it indicates either of the following: – The 16-bit IPv4 header checksum calculated by the MAC does not match the received checksum bytes. – The IP datagram version is not consistent with the Ethernet Type value. – Ethernet packet does not have the expected number of IP header bytes. This bit is valid when either bit 5 or bit 4 is set. |
| 2:0 | PT | Payload Type These bits indicate the type of payload encapsulated in the IP datagram processed by the Receive Checksum Offload Engine (COE): 000: Unknown type or IP/AV payload not processed 001: UDP 010: TCP 011: ICMP 100: IGMP if IPV4 Header Present bit is set Others: reserved. If the COE does not process the payload of an IP datagram because there is an IP header error or fragmented IP, it sets these bits to 3'b000. |

1. The Status fields in write-back format are valid only for the last descriptor (RDES3[28] is set).

- RDES2 normal descriptor (write-back format)

Table 576. RDES2 normal descriptor (write-back format)

| Bit | Name | Description |
|-------|--------|---|
| 31:29 | L3L4FM | <p>Layer 3 and Layer 4 Filter Number Matched</p> <p>These bits indicate the number of the Layer 3 and Layer 4 Filter that matched the received packet:</p> <ul style="list-style-type: none"> – 000: Filter 0 – 001: Filter 1 – 010: Filter 2 – 011: Filter 3 – 100: Filter 4 – 101: Filter 5 – 110: Filter 6 – 111: Filter 7 <p>This field is valid only when bit 28 or bit 27 is set high. When more than one filter matches, these bits give the number of lowest filter.</p> |
| 28 | L4FM | <p>Layer 4 Filter Match</p> <p>When this bit is set, it indicates that the received packet matches one of the enabled Layer 4 Port Number fields. This status is given only when one of the following conditions is true:</p> <ul style="list-style-type: none"> – Layer 3 fields are not enabled and all enabled Layer 4 fields match – All enabled Layer 3 and Layer 4 filter fields match <p>When more than one filter matches, this bit gives the layer 4 filter status of filter indicated by bits[31:29].</p> |
| 27 | L3FM | <p>Layer 3 Filter Match</p> <p>When this bit is set, it indicates that the received packet matches one of the enabled Layer 3 IP Address fields. This status is given only when one of the following conditions is true:</p> <ul style="list-style-type: none"> – All enabled Layer 3 fields match and all enabled Layer 4 fields are bypassed – All enabled filter fields match <p>When more than one filter matches, this bit gives the layer 3 filter status of filter indicated by bits[31:29].</p> |
| 26:19 | MADRM | <p>MAC Address Match or Hash Value</p> <p>When the HF bit is reset, this field contains the MAC address register number that matched the Destination address of the received packet. This field is valid only if the DAF bit is reset.</p> <p>When the HF bit is set, this field contains the Hash value computed by the MAC. A packet passes the Hash filter when the bit corresponding to the Hash value is set in the Hash filter register.</p> |
| 18 | HF | <p>Hash Filter Status</p> <p>When this bit is set, it indicates that the packet passed the MAC address Hash filter. its[26:19] indicate the Hash value.</p> |
| 17 | DAF | <p>Destination Address Filter Fail</p> <p>When this bit is set, it indicates that the packet failed the DA Filter in the MAC.</p> |
| 16 | SAF | <p>SA Address Filter Fail</p> <p>When this bit is set, it indicates that the packet failed the SA Filter in the MAC.</p> |

Table 576. RDES2 normal descriptor (write-back format) (continued)

| Bit | Name | Description |
|-------|----------|---|
| 15 | VF | VLAN Filter Status When this bit is set, it indicates that the VLAN Tag of received packet passed the VLAN filter. |
| 14:11 | Reserved | |
| 10 | ARPNR | ARP Reply Not Generated When this bit is set, it indicates that the MAC did not generate the ARP Reply for received ARP Request packet. This bit is set when the MAC is busy transmitting ARP reply to earlier ARP request (only one ARP request is processed at a time). |
| 9:0 | Reserved | |

- RDES3 normal descriptor (write-back format)

Table 577. RDES3 normal descriptor (write-back format)

| Bit | Name | Description |
|-----|------|--|
| 31 | OWN | Own bit 1: The DMA owns the descriptor. 0: The application owns the descriptor. The DMA clears this bit when either of the following conditions is true: The DMA completes the packet reception The buffers associated with the descriptor are full |
| 30 | CTXT | Receive Context Descriptor When this bit is set, it indicates that the current descriptor is a context type descriptor. The DMA writes 0 to this bit for normal receive descriptor. When CTXT and FD bits are used together, {CTXT, FD} possible values are: 00: Intermediate Descriptor 01: First Descriptor 10: Reserved 11: Descriptor error (due to all 1s) <i>Note: When a Descriptor error occurs, the Receive DMA closes the receive descriptor indicating a Descriptor error. This receive descriptor is skipped and the buffer addresses are not used to write the packet data. The receive DMA sets the CDE field of the Channel status register (ETH_DMCSR) but does not set the RI field, even when IOC field is set, as this is not marked as last receive descriptor for the packet. The subsequent valid receive descriptor is used to write the packet data.</i> |

Table 577. RDES3 normal descriptor (write-back format) (continued)

| Bit | Name | Description |
|-----|------|--|
| 29 | FD | <p>First Descriptor</p> <p>When this bit is set, it indicates that this descriptor contains the first buffer of the packet. If the size of the first buffer is 0, the second buffer contains the beginning of the packet. If the size of the second buffer is also 0, the next descriptor contains the beginning of the packet. Refer to the CTXT bit description for details on how to use the CTXT bit and FD bit together.</p> |
| 28 | LD | <p>Last Descriptor</p> <p>When this bit is set, it indicates that the buffers to which this descriptor is pointing are the last buffers of the packet.</p> |
| 27 | RS2V | <p>Receive Status RDES2 Valid</p> <p>When this bit is set, it indicates that the status in RDES2 is valid and it is written by the DMA. This bit is valid only when the LD bit of RDES3 is set.</p> |
| 26 | RS1V | <p>Receive Status RDES1 Valid</p> <p>When this bit is set, it indicates that the status in RDES1 is valid and it is written by the DMA. This bit is valid only when the LD bit of RDES3 is set.</p> |
| 25 | RS0V | <p>Receive Status RDES0 Valid</p> <p>When this bit is set, it indicates that the status in RDES0 is valid and it is written by the DMA. This bit is valid only when the LD bit of RDES3 is set.</p> |
| 24 | CE | <p>CRC Error</p> <p>When this bit is set, it indicates that a Cyclic Redundancy Check (CRC) Error occurred on the received packet. This field is valid only when the LD bit of RDES3 is set.</p> |
| 23 | GP | <p>Giant Packet</p> <p>When this bit is set, it indicates that the packet length exceeds the specified maximum Ethernet size of 1518, 1522, or 2000 bytes (9018 or 9022 bytes if jumbo packet enable is set). Giant packet indicates only the packet length. It does not cause any packet truncation.</p> |
| 22 | RWT | <p>Receive Watchdog Timeout</p> <p>When this bit is set, it indicates that the Receive Watchdog Timer has expired while receiving the current packet. The current packet is truncated after watchdog timeout.</p> |
| 21 | OE | <p>Overflow Error</p> <p>When this bit is set, it indicates that the received packet is damaged because of buffer overflow in Rx FIFO. This bit is set only when the DMA transfers a partial packet to the application. This happens only when the Rx FIFO is operating in the threshold mode. In the store-and-forward mode, all partial packets are dropped completely in Rx FIFO.</p> |
| 20 | RE | <p>Receive Error</p> <p>When this bit is set, it indicates that the ETH_RX_ER signal is asserted while the ETH_RX_DV signal is asserted during packet reception.</p> |

Table 577. RDES3 normal descriptor (write-back format) (continued)

| Bit | Name | Description |
|-------|------|--|
| 19 | DE | <p>Dribble Bit Error</p> <p>When this bit is set, it indicates that the received packet has a non-integer multiple of bytes (odd nibbles). This bit is valid only in the MII Mode.</p> |
| 18:16 | LT | <p>Length/Type Field</p> <p>This field indicates if the packet received is a length packet or a type packet. The encoding of the 3 bits is as follows:</p> <p>000: The packet is a length packet 001: The packet is a type packet. 011: The packet is a ARP Request packet type 100: The packet is a type packet with VLAN Tag 101: The packet is a type packet with Double VLAN tag 110: The packet is a MAC Control packet type 111: The packet is a OAM packet type 010: Reserved</p> |
| 15 | ES | <p>Error Summary</p> <p>When this bit is set, it indicates the logical OR of the following bits:</p> <p>RDES3[19]: Dribble Error RDES3[20]: Receive Error RDES3[21]: Overflow Error RDES3[22]: Watchdog Timeout RDES3[23]: Giant Packet RDES3[24]: CRC Error</p> <p>This field is valid only when the LD bit of RDES3 is set.</p> |
| 14:0 | PL | <p>Packet Length</p> <p>These bits indicate the byte length of the received packet that was transferred to system memory (including CRC).</p> <p>This field is valid when both the LD bit of RDES3 is set and the Overflow Error bit is reset. The packet length also includes the two bytes appended to the Ethernet packet when IP checksum calculation is enabled and the received packet is not a MAC control packet.</p> <p>When LD bit of RDES3 is reset, this field contains the accumulated number of bytes (partial) that have been transferred for the current packet.</p> |

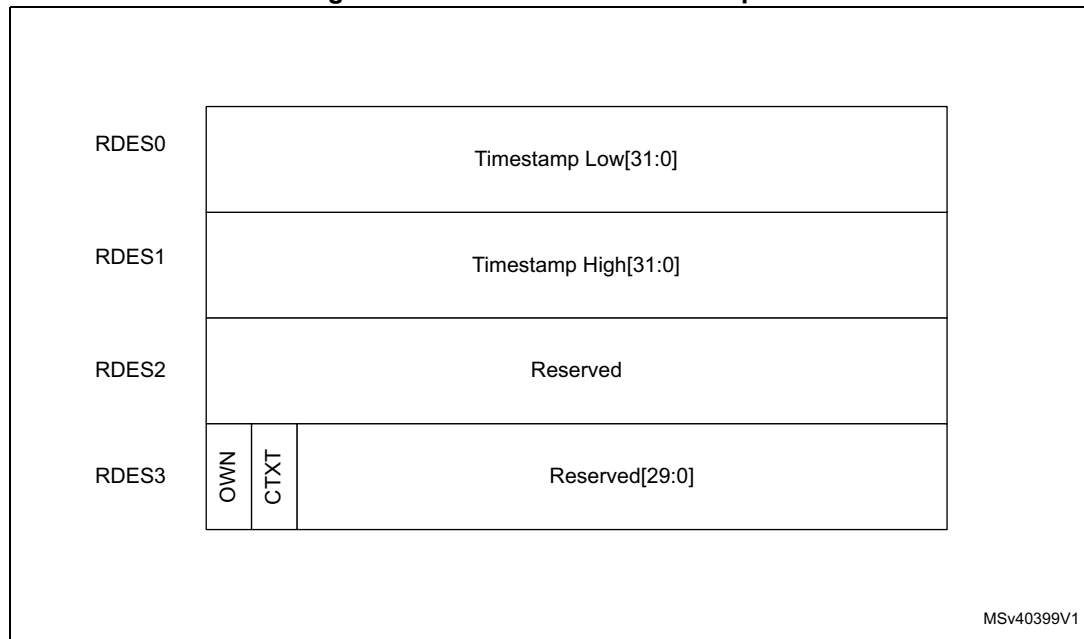

Receive context descriptor

This descriptor is read-only for the application. This descriptor can be written only by the DMA.

The context descriptor provides information about the extended status related to the last received packet. Bit 30 of RDES3 indicates the context type descriptor.

Figure 815 shows the format for Receive context descriptors. Table 578 to Table 581 provide a detailed description of all Receive context descriptors.

Figure 815. Receive context descriptor

- RDES0 context descriptor

Table 578. RDES0 context descriptor

| Bit | Name | Description |
|------|------|--|
| 31:0 | RTSL | Receive Packet Timestamp Low The DMA updates this field with least significant 32 bits of the timestamp captured for corresponding Receive packet. When this field and the RTSH field of RDES1 show all-ones value, the timestamp must be considered as corrupt. |

- RDES1 context descriptor

Table 579. RDES1 context descriptor

| Bit | Field | Description |
|------|-------|--|
| 31:0 | RTSH | Receive Packet Timestamp High The DMA updates this field with most significant 32 bits of the timestamp captured for corresponding receive packet. When this field and the RTSL field of RDES0 show all-ones value, the timestamp must be considered as corrupt. |

- RDES2 context descriptor

Table 580. RDES2 context descriptor

| Bit | Description |
|------|-------------|
| 31:0 | Reserved |

- RDES3 context descriptor

Table 581. RDES3 context descriptor

| Bit | Name | Description |
|------|------|--|
| 31 | OWN | Own Bit 1: The DMA owns the descriptor 0: The application owns the descriptor. The DMA clears this bit when either of the following conditions is true: The DMA completes the packet reception The buffers associated with the descriptor are full |
| 30 | CTXT | Receive Context Descriptor When this bit is set, it indicates that the current descriptor is a context descriptor. The DMA writes 1'b1 to this bit for context descriptor. |
| 29:0 | | Reserved |

58.11 Ethernet registers

58.11.1 Ethernet register maps

This section provides the following register maps:

- DMA registers (see [Section 58.11.2: Ethernet DMA registers](#))
- MTL registers (see [Section 58.11.3: Ethernet MTL registers](#))
- MAC registers including MMC register (see [Section 58.11.4: Ethernet MAC and MMC registers](#))

58.11.2 Ethernet DMA registers

DMA mode register (ETH_DMAMR)

Address offset: 0x1000

Reset value: 0x0000 0000

The DMA mode register establishes the bus operating modes for the DMA.

| | | | | | | | | | | | | | | | |
|------|---------|------|------|------|------|------|------|------|------|------|------|------|------|-----------|-----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | INTM[1:0] | |
| | | | | | | | | | | | | | | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | PR[2:0] | | | TXPR | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | DA | SWR |
| | rw | rw | rw | rw | | | | | | | | | | rw | rw |

Bits 31:18 Reserved, must be kept at reset value.

Bits 17:16 **INTM[1:0]**: Interrupt Mode

This field defines the interrupt mode of the Ethernet peripheral.

The behavior of the interrupt signal and of the RI/TI bits in the ETH_DMACSR register changes depending on the INTM value (refer to [Table 557: Transfer complete interrupt behavior](#)).

Bit 15 Reserved, must be kept at reset value.

Bits 14:12 **PR[2:0]**: Priority ratio

These bits control the priority ratio in weighted round-robin arbitration between the Rx DMA and Tx DMA. These bits are valid only when the DA bit is reset. The priority ratio is Rx:Tx or Tx:Rx depending on whether the TXPR bit is reset or set.

000: The priority ratio is 1:1

001: The priority ratio is 2:1

010: The priority ratio is 3:1

011: The priority ratio is 4:1

100: The priority ratio is 5:1

101: The priority ratio is 6:1

110: The priority ratio is 7:1

111: The priority ratio is 8:1

Bit 11 **TXPR**: Transmit priority

When set, this bit indicates that the Tx DMA has higher priority than the Rx DMA during arbitration for the system-side bus.

Bits 10:2 Reserved, must be kept at reset value.

Bit 1 **DA**: DMA Tx or Rx Arbitration Scheme

This bit specifies the arbitration scheme between the Transmit and Receive paths of all channels:

0: Weighted Round-Robin with Rx:Tx or Tx:Rx

The priority between the paths is according to the priority specified in Bits[14:12] and the priority weight is specified in the TXPR bit.

1: Fixed priority

The Tx path has priority over the Rx path when the TXPR bit is set. Otherwise, the Rx path has priority over the Tx path.

Bit 0 **SWR**: Software Reset

When this bit is set, the MAC and the DMA controller reset the logic and all internal registers of the DMA, MTL, and MAC. This bit is automatically cleared after the reset operation is complete in all clock domains. Before reprogramming any register, a value of zero should be read in this bit.

Note: The reset operation is complete only when all resets in all active clock domains are deasserted. Therefore, it is essential that all PHY inputs clocks (applicable for the selected PHY interface) are present for software reset completion. The time to complete the software reset operation depends on the frequency of the slowest active clock.

System bus mode register (ETH_DMASBMR)

Address offset: 0x1004

Reset value: 0x0000 0000

The System bus mode register controls the behavior of the AHB master. It mainly controls burst splitting and number of outstanding requests.

| | | | | | | | | | | | | | | | |
|-----|-----|------|-----|------|------|------|------|------|------|------|------|------|------|------|-----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res | Res | Res | Res | Res | Res | Res | Res | Res | Res | Res | Res | Res | Res | Res | Res |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RB | MB | Res. | AAL | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | FB |
| r | r | | rw | | | | | | | | | | | | rw |

Bits 31:16 Reserved, must be kept at reset value.

Bit 15 **RB**: Rebuild INCRx Burst

When this bit is set high and the AHB master gets SPLIT, RETRY, or Early Burst Termination (EBT) response, the AHB master interface rebuilds the pending beats of any initiated burst transfer with INCRx and SINGLE transfers. By default, the AHB master interface rebuilds pending beats of an EBT with an unspecified (INCR) burst.

Bit 14 **MB**: Mixed Burst

When this bit is set high and the FB bit is low, the AHB master performs undefined bursts transfers (INCR) for burst length of 16 or more. For burst length of 16 or less, the AHB master performs fixed burst transfers (INCRx and SINGLE).

Bit 13 Reserved, must be kept at reset value.

Bit 12 **AAL**: Address-Aligned Beats

When this bit is set to 1, the master performs address-aligned burst transfers on Read and Write channels.

Bits 11:1 Reserved, must be kept at reset value.

Bit 0 **FB**: Fixed Burst Length

When this bit is set to 1, the AHB master will initiate burst transfers of specified length (INCRx or SINGLE).

When this bit is set to 0, the AHB master will initiate transfers of unspecified length (INCR) or SINGLE transfers.

Interrupt status register (ETH_DMAISR)

Address offset: 0x1008

Reset value: 0x0000 0000

The application reads this Interrupt Status register during interrupt service routine or polling to determine the interrupt status of DMA channels, MTL queues, and the MAC.

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|-------|-------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | MACIS | MTLIS |
| | | | | | | | | | | | | | | r | r |

| | | | | | | | | | | | | | | | r |

Bits 31:18 Reserved, must be kept at reset value.

Bit 17 **MACIS**: MAC Interrupt Status

This bit indicates an interrupt event in the MAC. To reset this bit to 1'b0, the software must read the corresponding register in the MAC to get the exact cause of the interrupt and clear its source.

Bit 16 **MTLIS**: MTL Interrupt Status

This bit indicates an interrupt event in the MTL. To reset this bit to 1'b0, the software must read the corresponding register in the MTL to get the exact cause of the interrupt and clear its source.

Bits 15:1 Reserved, must be kept at reset value.

Bit 0 **DC0IS**: DMA Channel Interrupt Status

This bit indicates an interrupt event in DMA Channel. To reset this bit to 0, the software must read the corresponding register in DMA Channel to get the exact cause of the interrupt and clear its source.

Debug status register (ETH_DMADSR)

Address offset: 0x100C

Reset value: 0x0000 0000

The Debug status register gives the Receive and Transmit process status for DMA Channel for debugging purpose.

| | | | | | | | | | | | | | | | |
|-----------|------|------|------|-----------|------|------|------|------|------|------|------|------|------|------|----------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| r | r | r | r | r | r | r | r | | | | | | | | r |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:12 **TPS0[3:0]**: DMA Channel Transmit Process State

- This field indicates the Tx DMA FSM state for Channel:
- 000: Stopped (Reset or Stop Transmit Command issued)
- 001: Running (Fetching Tx Transfer Descriptor)
- 010: Running (Waiting for status)
- 011: Running (Reading Data from system memory buffer and queuing it to the Tx buffer (Tx FIFO))
- 100: Timestamp write state
- 101: Reserved for future use
- 110: Suspended (Tx Descriptor Unavailable or Tx Buffer Underflow)
- 111: Running (Closing Tx Descriptor)
- The MSB of this field always returns 0. This field does not generate an interrupt.

Bits 11:8 **RPS0[3:0]**: DMA Channel Receive Process State

- This field indicates the Rx DMA FSM state for Channel:
- 000: Stopped (Reset or Stop Receive Command issued)
- 001: Running (Fetching Rx Transfer Descriptor)
- 010: Reserved for future use
- 011: Running (Waiting for Rx packet)
- 100: Suspended (Rx Descriptor Unavailable)
- 101: Running (Closing the Rx Descriptor)
- 110: Timestamp write state
- 111: Running (Transferring the received packet data from the Rx buffer to the system memory)
- The MSB of this field always returns 0. This field does not generate an interrupt.

Bits 7:1 Reserved, must be kept at reset value.

Bit 0 **AXWHSTS**: AHB Master Write Channel

When high, this bit indicates that the write channel of the AHB master FMSs are in non-idle state.

Channel control register (ETH_DMACCR)

Address offset: 0x1100

Reset value: 0x0000 0000

The DMA Channel control register specifies the MSS value for segmentation, length to skip between two descriptors, and also the features such as header splitting and 8xPBL mode.

| | | | | | | | | | | | | | | | |
|------|------|-----------|------|------|------|------|------|------|------|------|----------|----|----|------|-------|

| Res. | Res. | MSS[13:0] | | | | | | | | | | | | | |
| | | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:21 Reserved, must be kept at reset value.

Bits 20:18 **DSL[2:0]**: Descriptor Skip Length

This bit specifies the 32-bit word number to skip between two unchained descriptors. The address skipping starts from the end of the current descriptor to the start of the next descriptor.

When the DSL value is equal to zero, the DMA takes the descriptor table as contiguous.

Bit 17 Reserved, must be kept at reset value.

Bit 16 **PBLX8**: 8xPBL mode

When this bit is set, the PBL value programmed in Bits[21:16] in *Channel transmit control register (ETH_DMACTXCR)* is multiplied eight times. Therefore, the DMA transfers the data in 8, 16, 32, 64, 128, and 256 beats depending on the PBL value.

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:0 **MSS[13:0]**: Maximum Segment Size

This field specifies the maximum segment size that should be used while segmenting the packet. This field is valid only if the TSE bit of *Channel transmit control register (ETH_DMACTXCR)* is set.

The value programmed in this field must be more than the configured Data width in bytes. It is recommended to use a MSS value of 64 bytes or more.

Channel transmit control register (ETH_DMACTXCR)

Address offset: 0x1104

Reset value: 0x0000 0000

The DMA Channel Transmit Control register controls the Tx features such as PBL, TCP segmentation, and Tx Channel weights.

| | | | | | | | | | | | | | | | |

| | | | rw | | | | | | | | rw | | | | rw |

Bits 31:22 Reserved, must be kept at reset value.

Bits 21:16 **TXPBL[5:0]**: Transmit Programmable Burst Length

These bits indicate the maximum number of beats to be transferred in one DMA data transfer. This is the maximum value that is used in a single block Read or Write. The DMA always attempts to burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior.

To transfer more than 32 beats, perform the following steps:

- a) Set the PBLx8 mode in ETH_DMCCR.
- b) Set the TXPBL[5:0].

Note: The maximum value of TXPBL must be less than or equal to half the Tx Queue size (TQS field of *Tx queue operating mode Register (ETH_MTLTXQOMR)*) in terms of beats. This is required so that the Tx Queue has space to store at least another Tx PBL worth of data while the MTL Tx Queue Controller is transferring data to MAC. The total locations in Tx Queue of size 2048 bytes is 512, TXPBL and 8xPBL needs to be programmed to less than or equal to 512/2.

Bits 15:13 Reserved, must be kept at reset value.

Bit 12 **TSE**: TCP Segmentation Enabled

When this bit is set, the DMA performs the TCP segmentation for packets in Channel x. The TCP segmentation is done only for those packets for which the TSE bit (TDES0[19]) is set in the Tx Normal descriptor. When this bit is set, the TxPBL value must be greater than or equal to 4.

Bits 11:5 Reserved, must be kept at reset value.

Bit 4 **OSF**: Operate on Second Packet

When this bit is set, it instructs the DMA to process the second packet of the Transmit data even before the status for the first packet is obtained.

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **ST**: Start or Stop Transmission Command

When this bit is set, transmission is placed in the Running state. The DMA checks the Transmit list at the current position for a packet to be transmitted.

The DMA tries to acquire descriptor from either of the following positions:

- The current position in the list: this is the base address of the Transmit list set by the ETH_DMACXDLAR register.
- The position at which the transmission was previously stopped

If the DMA does not own the current descriptor, the transmission enters the Suspended state and the TBU bit of the ETH_DMACSR is set. The Start Transmission command is effective only when the transmission is stopped. If the command is issued before setting the ETH_DMACXDLAR register, the DMA behavior is unpredictable.

When this bit is reset, the transmission process is placed in the Stopped state after completing the transmission of the current packet. The Next Descriptor position in the Transmit list is saved, and it becomes the current position when the transmission is restarted. To change the list address, you need to program ETH_DMACXDLAR register with a new value when this bit is reset. The new value is considered when this bit is set again. The stop transmission command is effective only when the transmission of the current packet is complete or the transmission is in the Suspended state.

Channel receive control register (ETH_DMARXCR)

Address offset: 0x1108

Reset value: 0x0000 0000

The DMA Channel Receive Control register controls the Rx features such as PBL, buffer size, and extended status.

| | | | | | | | | | | | | | | | |
|------|------------|-----|-----|-----|-----|-----|-----|-----|-----|------------|----|----|----|----|----|

| | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bit 31 RPF: DMA Rx Channel Packet Flush

When this bit is set to 1, the Ethernet peripheral automatically flushes the packet from the Rx queues destined to DMA Rx Channel when the DMA Rx Channel is stopped after a system bus error has occurred. When this bit remains set and the DMA is re-started by the software driver, the packets residing in the Rx Queues that were received when this RxDMA was stopped, are flushed out. The packets that are received by the MAC after the RxDMA is re-started are routed to the RxDMA. The flushing happens on the Read side of the Rx queue. When this bit is set to 0 the Ethernet peripheral does not flush the packet in the Rx queue destined to DMA Rx Channel after the DMA is stopped due to a system bus error. This might cause head-of-line blocking in the corresponding RxQueue.

Note: The stopping of packet flow from a Rx DMA Channel to the application by setting RPF works only when there is one-to-one mapping of Rx Queue to Rx DMA channels. In Dynamic mapping mode, setting RPF bit in ETH_DMARXCR register might flush packets from unintended Rx Queues which are destined to the stopped Rx DMA Channel.

Bits 30:22 Reserved, must be kept at reset value.

Bits 21:16 RXPBL[5:0]: Receive Programmable Burst Length

These bits indicate the maximum number of beats to be transferred in one DMA data transfer. This is the maximum value that is used in a single block Read or Write. The DMA always attempts to burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior.

To transfer more than 32 beats, perform the following steps:

- a) Set the PBLx8 mode in the ETH_DMCCR.
- b) Set the RXPBL[5:0].

Note: The maximum value of RXPBL must be less than or equal to half the Rx Queue size (RQS field of Rx queue operating mode register (ETH_MTLRXQOMR)) in terms of beats. This is required so that the Rx Queue has space to store at least another Rx PBL worth of data while the MTL Rx Queue Controller is transferring data to MAC. The total locations in Rx Queue of size 2048 bytes is 512, RXPBL and 8xPBL needs to be programmed to less than or equal to 512/2.

Bit 15 Reserved, must be kept at reset value.

Bits 14:1 **RBSZ[13:0]**: Receive Buffer size

This field indicates the size of the Rx buffers specified in bytes. The maximum buffer size is limited to 16 Kbytes.

Note: The buffer size must be a multiple of 4. This is required even if the value of buffer address pointer is not aligned to bus width. If the buffer size is not a multiple of 4, it may result into an undefined behavior.

The LSB bits (1:0) are ignored and the DMA internally takes the LSB bits as all-zero. Therefore, these LSB bits are read-only (RO).

Bit 0 **SR**: Start or Stop Receive

When this bit is set, the DMA tries to acquire the descriptor from the Receive list and processes the incoming packets.

The DMA tries to acquire descriptor from either of the following positions:

- The current position in the list: this is the address set by the [Channel Rx descriptor list address register \(ETH_DMOCRDLAR\)](#).
- The position at which the Rx process was previously stopped

If the DMA does not own the current descriptor, the reception is suspended and the RBU bit of the ETH_DMCSR is set. The Start Receive command is effective only when the reception is stopped. If the command is issued before setting the [Channel Rx descriptor list address register \(ETH_DMOCRDLAR\)](#), the DMA behavior is unpredictable.

When this bit is reset, the Rx DMA operation is stopped after the transfer of the current packet. The next descriptor position in the Receive list is saved, and it becomes the current position after the Rx process is restarted. The Stop Receive command is effective only when the Rx process is in the Running (waiting for Rx packet) or Suspended state.

Channel Tx descriptor list address register (ETH_DMACTXDLAR)

Address offset: 0x1114

Reset value: 0x0000 0000

Channel Tx Descriptor List Address register points the DMA to the start of Transmit descriptor list. The descriptor lists reside in the physical memory space of the application and must be word-aligned. The DMA internally converts it to bus width aligned address by making the corresponding LSB to low.

You can write to this register only when the Tx DMA has stopped, that is, the ST bit is set to zero in ETH_DMACTXCR register. When stopped, this register can be written with a new descriptor list address. When you set ST bit to 1, the DMA takes the newly-programmed descriptor base address. If this register is not changed when ST bit is set to 0, the DMA takes the descriptor address where it was stopped earlier.

| | | | | | | | | | | | | | | | |

| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | r | r |

Bits 31:0 **TDESLA[31:0]**: Start of Transmit List

This field contains the base address of the first descriptor in the Transmit descriptor list. The DMA ignores the LSB bits (1:0) for 32-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO).

Channel Rx descriptor list address register (ETH_DMACRXDLAR)

Address offset: 0x111C

Reset value: 0x0000 0000

The Channel Rx Descriptor List Address register points the DMA to the start of Receive descriptor list.

This register points to the start of the Receive Descriptor List. The descriptor lists reside in the physical memory space of the application and must be word-aligned. The DMA internally converts it to bus width aligned address by making the corresponding LS bits low. Writing to this register is permitted only when reception is stopped. When stopped, this register must be written to before the receive Start command is given. You can write to this register only when Rx DMA has stopped, that is, SR bit is set to zero in *ETH_DMACRXCR* register. When stopped, this register can be written with a new descriptor list address.

When you set the SR bit to 1, the DMA takes the newly programmed descriptor base address.

Bits 31:0 **RDESLA[31:0]**: Start of Receive List

This field contains the base address of the first descriptor in the Rx Descriptor list. The DMA ignores the LSB bits (1:0) for 32-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO).

Channel Tx descriptor tail pointer register (ETH_DMACTXDTPR)

Address offset: 0x1120

Reset value: 0x0000 0000

The Channel Tx Descriptor Tail Pointer register points to an offset from the base and indicates the location of the last valid descriptor.

| | | | | | | | | | | | | | | | |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | r | r |

Bits 31:0 **TDT[31:0]**: Transmit Descriptor Tail Pointer

This field contains the tail pointer for the Tx descriptor ring. The software writes the tail pointer to add more descriptors to the Tx channel. The hardware tries to transmit all packets referenced by the descriptors between the head and the tail pointer registers.

Channel Rx descriptor tail pointer register (ETH_DMARXDTPR)

Address offset: 0x1128

Reset value: 0x0000 0000

The Channel Rx Descriptor Tail Pointer Points to an offset from the base and indicates the location of the last valid descriptor.

| | | | | | | | | | | | | | | | |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | r | r |

Bits 31:0 **RDT[31:0]**: Receive Descriptor Tail Pointer

This field contains the tail pointer for the Rx descriptor ring. The software writes the tail pointer to add more descriptors to the Rx channel. The hardware tries to write all received packets to the descriptors referenced between the head and the tail pointer registers.

Channel Tx descriptor ring length register (ETH_DMACTXRLR)

Address offset: 0x112C

Reset value: 0x0000 0000

The Tx Descriptor Ring Length register contains the length of the Transmit descriptor ring.

| | | | | | | | | | | | | | | | |

Bits 31:10 Reserved, must be kept at reset value.

Bits 9:0 **TDRL[9:0]**: Transmit Descriptor Ring Length

This field sets the maximum number of Tx descriptors in the circular descriptor ring. The maximum number of descriptors is limited to 1K descriptors. It is recommended to put a minimum ring descriptor length of 4.

For example, you can program any value up to 0x3FF in this field. This field is 10 bits wide, if you program 0x3FF, you can have 1024 descriptors. If you want to have 10 descriptors, program it to a value of 0x9.

Channel Rx descriptor ring length register (ETH_DMCCRRLR)

Address offset: 0x1130

Reset value: 0x0000 0000

The Channel Rx Descriptor Ring Length register contains the length of the Receive descriptor circular ring.

| | | | | | | | | | | | | | | | |

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:16 **ARBS[7:0]**: Alternate Receive Buffer Size

Indicates size in bytes for Buffer 1 when ARBS[7:0] is programmed to a non-zero value. When ARBS[7:0] = 0, Rx Buffer1 and Rx Buffer2 sizes are based on RBSZ[13:0] field of [Channel receive control register \(ETH_DMCCRCCR\)](#).

Bits 15:10 Reserved, must be kept at reset value.

Bits 9:0 **RDRL[9:0]**: Receive Descriptor Ring Length

This register sets the maximum number of Rx descriptors in the circular descriptor ring. The maximum number of descriptors is limited to 1K descriptors. For example, you can program any value up to 0x3FF in this field. This field is 10-bit wide. If you program 0x3FF, you can have 1024 descriptors. If you want to have 10 descriptors, program it to a value of 0x9.

Channel interrupt enable register (ETH_DMCCRER)

Address offset: 0x1134

Reset value: 0x0000 0000

The Channel Interrupt Enable register enables the interrupts reported by the Status register.

| | | | | | | | | | | | | | | | |

Bits 31:16 Reserved, must be kept at reset value.

Bit 15 **NIE**: Normal Interrupt Summary Enable

When this bit is set, the normal interrupt summary is enabled. This bit enables the following interrupts in the [Channel status register \(ETH_DMCSR\)](#):

Bit 0: Transmit Interrupt

Bit 2: Transmit Buffer Unavailable

Bit 6: Receive Interrupt

Bit 11: Early Receive Interrupt

When this bit is reset, the normal interrupt summary is disabled.

Bit 14 **AIE**: Abnormal Interrupt Summary Enable

When this bit is set, the abnormal interrupt summary is enabled. This bit enables the following interrupts in the [Channel status register \(ETH_DMCSR\)](#):

Bit 1: Transmit Process Stopped

Bit 7: Rx Buffer Unavailable

Bit 8: Receive Process Stopped

Bit 9: Receive Watchdog Timeout

Bit 10: Early Transmit Interrupt

Bit 12: Fatal Bus Error

When this bit is reset, the abnormal interrupt summary is disabled.

Bit 13 **CDEE**: Context Descriptor Error Enable

When this bit is set along with the AIE bit, the Context Descriptor error interrupt is enabled. When this bit is reset, the Context Descriptor error interrupt is disabled.

Bit 12 **FBEE**: Fatal Bus Error Enable

When this bit is set along with the AIE bit, the Fatal Bus error interrupt is enabled. When this bit is reset, the Fatal Bus Error error interrupt is disabled.

Bit 11 **ERIE**: Early Receive Interrupt Enable

When this bit is set along with the NIE bit, the Early Receive interrupt is enabled. When this bit is reset, the Early Receive interrupt is disabled.

Bit 10 **ETIE**: Early Transmit Interrupt Enable

When this bit is set along with the AIE bit, the Early Transmit interrupt is enabled. When this bit is reset, the Early Transmit interrupt is disabled.

Bit 9 **RWTE**: Receive Watchdog Timeout Enable

When this bit is set along with the AIE bit, the Receive Watchdog Timeout interrupt is enabled. When this bit is reset, the Receive Watchdog Timeout interrupt is disabled.

Bit 8 **RSE**: Receive Stopped Enable

When this bit is set along with the AIE bit, the Receive Stopped Interrupt is enabled. When this bit is reset, the Receive Stopped interrupt is disabled.

Bit 7 **RBUE**: Receive Buffer Unavailable Enable

When this bit is set along with the AIE bit, the Receive Buffer Unavailable interrupt is enabled. When this bit is reset, the Receive Buffer Unavailable interrupt is disabled.

Bit 6 **RIE**: Receive Interrupt Enable

When this bit is set along with the NIE bit, the Receive Interrupt is enabled. When this bit is reset, the Receive Interrupt is disabled.

Bits 5:3 Reserved, must be kept at reset value.

Bit 2 **TBUE**: Transmit Buffer Unavailable Enable

When this bit is set along with the NIE bit, the Transmit Buffer Unavailable interrupt is enabled. When this bit is reset, the Transmit Buffer Unavailable interrupt is disabled.

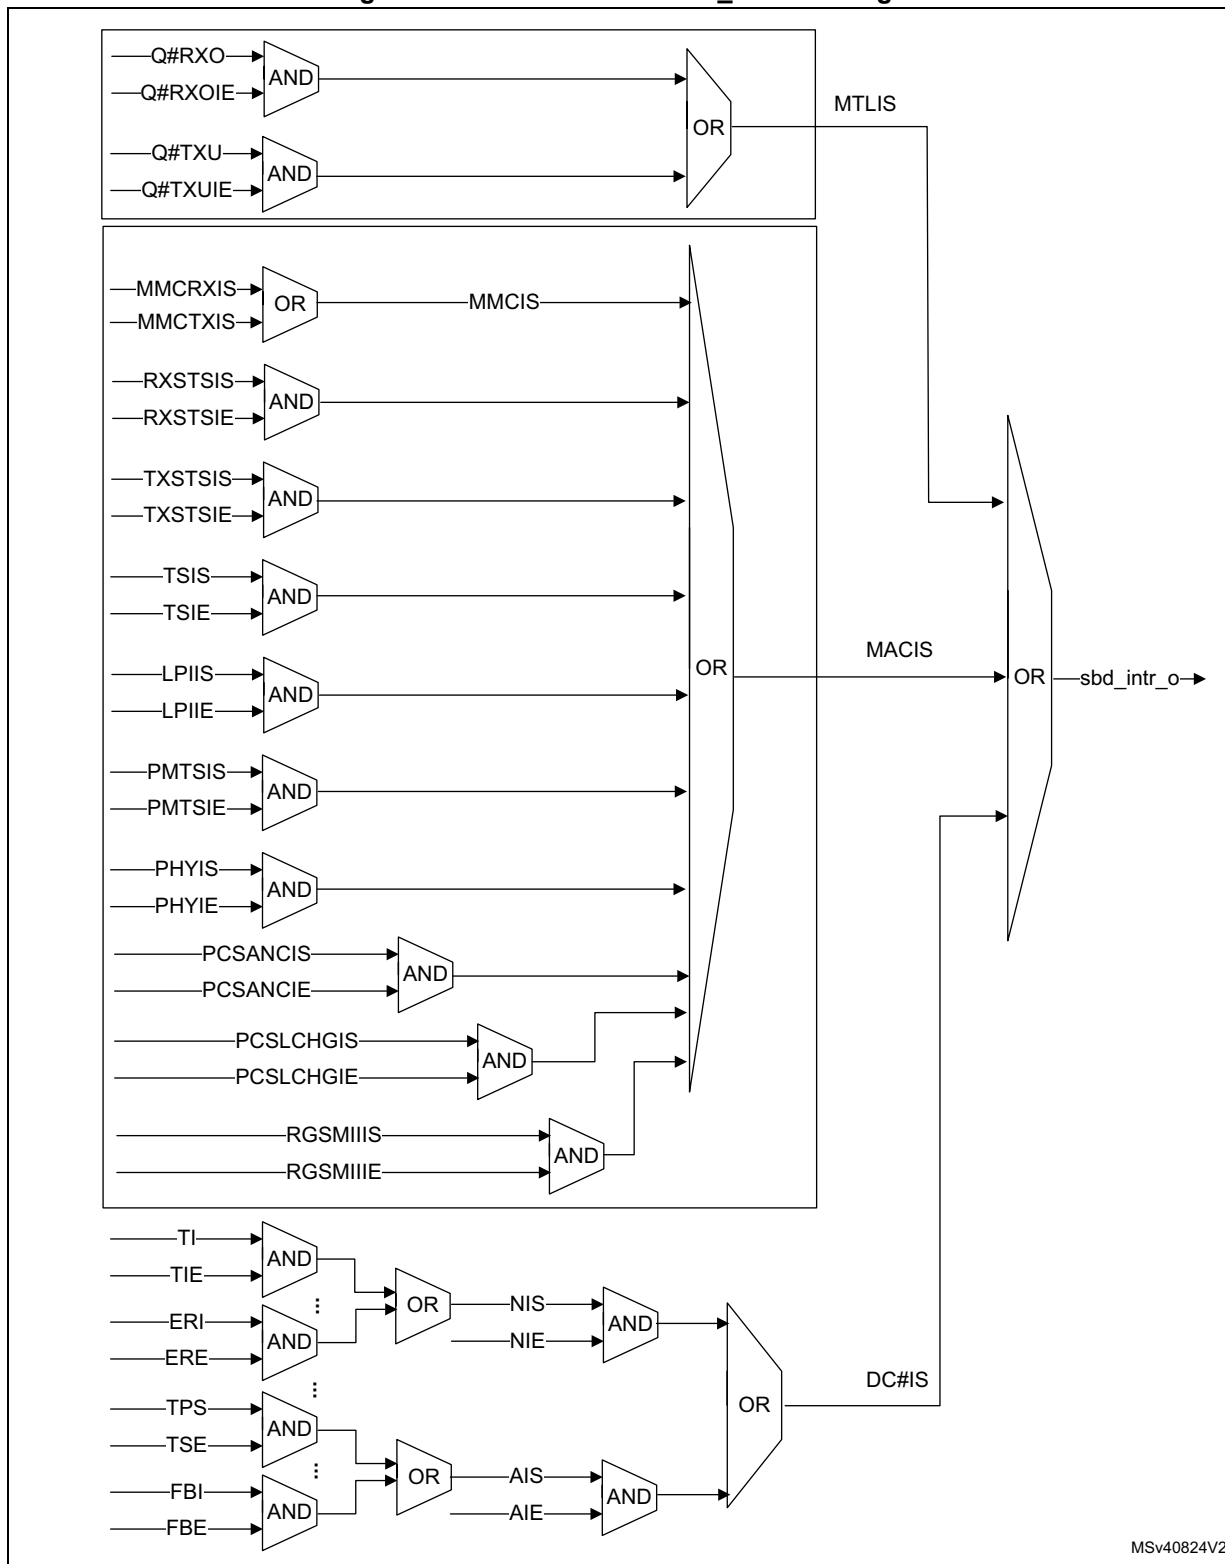

Bit 1 **TXSE**: Transmit Stopped Enable

When this bit is set along with the AIE bit, the Transmission Stopped interrupt is enabled. When this bit is reset, the Transmission Stopped interrupt is disabled.

Bit 0 **TIE**: Transmit Interrupt Enable

When this bit is set along with the NIE bit, the Transmit Interrupt is enabled. When this bit is reset, the Transmit Interrupt is disabled.

Figure 816. Generation of ETH_DMAISR flags

Channel Rx interrupt watchdog timer register (ETH_DMARXIWTR)

Address offset: 0x1138

Reset value: 0x0000 0000

The Receive Interrupt Watchdog Timer register indicates the watchdog timeout for Receive Interrupt (RI) from the DMA. When this register is written with a non-zero value, it enables the watchdog timer for the RI bit of the *Channel status register (ETH_DMACSR)*.

| | | | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|----------|------|------|------|------|------|-----------|----|--|--|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | | |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | RWTU[1:0] | | | |
| | | | | | | | | | | | | | | rw | rw | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | |

| | | | | | | | | rw | rw | rw | rw | rw | rw | rw | rw | | |

Bits 31:18 Reserved, must be kept at reset value.

Bits 17:16 **RWTU[1:0]**: Receive Interrupt Watchdog Timer Count Units

This field indicates the number of system clock cycles corresponding to one unit in RWT[7:0] field.

- 00: 256
- 01: 512
- 10: 1024
- 11: 2048

For example, when RWT[7:0] = 2 and RWTU[1:0] = 1, the watchdog timer is set for 2 * 512 = 1024 system clock cycles.

Bits 15:8 Reserved, must be kept at reset value.

Bits 7:0 **RWT[7:0]**: Receive Interrupt Watchdog Timer Count

This field indicates the number of system clock cycles, multiplied by factor indicated in RWTU field, for which the watchdog timer is set.

The watchdog timer is triggered with the programmed value after the Rx DMA completes the transfer of a packet for which the RI bit is not set in the ETH_DMACSR, because of the setting of Interrupt Enable bit in the corresponding descriptor RDES3[30].

When the watchdog timer runs out, the RI bit is set and the timer is stopped. The watchdog timer is reset when the RI bit is set high because of automatic setting of RI as per the Interrupt Enable bit RDES3[30] of any received packet.

Channel current application transmit descriptor register (ETH_DMACCATXDR)

Address offset: 0x1144

Reset value: 0x0000 0000

The Channel Current Application Transmit Descriptor register points to the current Transmit descriptor read by the DMA.

Bits 31:0 **CURTDESAPTR[31:0]**: Application Transmit Descriptor Address Pointer
 The DMA updates this pointer during Tx operation. This pointer is cleared on reset.

Channel current application receive descriptor register (ETH_DMACCARXDR)

Address offset: 0x114C

Reset value: 0x0000 0000

The Channel Current Application Receive Descriptor register points to the current Receive descriptor read by the DMA.

Bits 31:0 **CURRDESAPTR[31:0]**: Application Receive Descriptor Address Pointer
 The DMA updates this pointer during Rx operation. This pointer is cleared on reset.

Channel current application transmit buffer register (ETH_DMACCATXBR)

Address offset: 0x1154

Reset value: 0x0000 0000

The Channel Current Application Transmit Buffer Address register points to the current Tx buffer address read by the DMA.

| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:0 **CURRBUFAPTR[31:0]**: Application Receive Buffer Address Pointer
 The DMA updates this pointer during Rx operation. This pointer is cleared on reset.

Channel status register (ETH_DMACSR)

Address offset: 0x1160

Reset value: 0x0000 0000

The software driver (application) reads the Status register during interrupt service routine or polling to determine the status of the DMA.

Bits 31:22 Reserved, must be kept at reset value.

Bits 21:19 **REB[2:0]**: Rx DMA Error Bits

This field indicates the type of error that caused a Bus Error. For example, error response on the AHB interface.

Bit [2]: Error during data transfer by Rx DMA when 1, no Error during data transfer by Rx DMA when 0.

Bit[1]: Error during descriptor access when 1, Error during data buffer access when 0

Bit[0]: Error during read transfer when 1, Error during write transfer when 0

This field is valid only when the FBE bit is set. This field does not generate an interrupt.

Bits 18:16 **TEB[2:0]**: Tx DMA Error Bits

This field indicates the type of error that caused a Bus Error. For example, error response on the AHB interface.

Bit[2]: Error during data transfer by Tx DMA when 1, no Error during data transfer by Tx DMA when 0

Bit[1]: Error during descriptor access when 1, Error during data buffer access when 0

Bit[0]: Error during read transfer when 1, Error during write transfer when 0

This field is valid only when the FBE bit is set. This field does not generate an interrupt.

Bit 15 **NIS**: Normal Interrupt Summary

Normal Interrupt Summary bit value is the logical OR of the following bits when the corresponding interrupt bits are enabled in the ETH_DMACIER register:

Bit 0: Transmit Interrupt

Bit 2: Transmit Buffer Unavailable

Bit 6: Receive Interrupt

Bit 11: Early Receive Interrupt

Only unmasked bits (interrupts for which interrupt enable is set in ETH_DMACIER register) affect the Normal Interrupt Summary bit.

This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit which causes NIS to be set is cleared.

Bit 14 **AIS**: Abnormal Interrupt Summary

Abnormal Interrupt Summary bit value is the logical OR of the following when the corresponding interrupt bits are enabled in the ETH_DMACIER register:

Bit 1: Transmit Process Stopped

Bit 7: Receive Buffer Unavailable

Bit 8: Receive Process Stopped

Bit 10: Early Transmit Interrupt

Bit 12: Fatal Bus Error

Bit 13: Context Descriptor Error

Only unmasked bits affect the Abnormal Interrupt Summary bit.

This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit, which causes AIS to be set, is cleared.

Bit 13 **CDE**: Context Descriptor Error

This bit indicates that the DMA Tx/Rx engine received a descriptor error, which indicates invalid context in the middle of packet flow (intermediate descriptor) or all one's descriptor in Tx case and on Rx side it indicates DMA has read a descriptor with either of the buffer address as ones which is considered to be invalid.

Bit 12 **FBE**: Fatal Bus Error

This bit indicates that a bus error occurred (as described in the EB field). When this bit is set, the corresponding DMA channel engine disables all bus accesses.

- Bit 11 **ERI**: Early Receive Interrupt
This bit indicates that the DMA filled the first data buffer of the packet. The RI bit of this register automatically clears this bit.
- Bit 10 **ETI**: Early Transmit Interrupt
This bit indicates that the packet to be transmitted is fully transferred to the MTL Tx FIFO.
- Bit 9 **RWT**: Receive Watchdog Timeout
This bit is asserted when a packet with length greater than 2,048 bytes (10,240 bytes when Jumbo Packet mode is enabled) is received.
- Bit 8 **RPS**: Receive Process Stopped
This bit is asserted when the Rx process enters the Stopped state.
- Bit 7 **RBU**: Receive Buffer Unavailable
This bit indicates that the application owns the next descriptor in the Receive list, and the DMA cannot acquire it. The Rx process is suspended. To resume processing Rx descriptors, the application should change the ownership of the descriptor and issue a Receive Poll Demand command. If this command is not issued, the Rx process resumes when the next recognized incoming packet is received. In ring mode, the application should advance the Receive Descriptor Tail Pointer register of a channel. This bit is set only when the DMA owns the previous Rx descriptor.
- Bit 6 **RI**: Receive Interrupt
This bit indicates that the packet reception is complete. When packet reception is complete, Bit 31 of RDES1 is reset in the last descriptor, and the specific packet status information is updated in the descriptor.
The reception remains in the Running state.
- Bits 5:3 Reserved, must be kept at reset value.
- Bit 2 **TBU**: Transmit Buffer Unavailable
This bit indicates that the application owns the next descriptor in the Transmit list, and the DMA cannot acquire it. Transmission is suspended. The TPSi field of the *Debug status register (ETH_DMADSR)* register explains the Transmit Process state transitions.
To resume processing the Transmit descriptors, the application should do the following:
1. Change the ownership of the descriptor by setting Bit 31 of TDES3.
2. Issue a Transmit Poll Demand command.
For ring mode, the application should advance the Transmit Descriptor Tail Pointer register of a channel.
- Bit 1 **TPS**: Transmit Process Stopped
This bit is set when the transmission is stopped.
- Bit 0 **TI**: Transmit Interrupt
This bit indicates that the packet transmission is complete. When transmission is complete, Bit 31 of TDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor.

Channel missed frame count register (ETH_DMAMFCR)

Address offset: 0x116C

Reset value: 0x0000 0000

This register has the number of packet counter that got dropped by the DMA either due to Bus Error or due to programming RPF field in *Channel receive control register (ETH_DMARXCR)* register.

| rc_r | | | | | rc_r | rc_r | rc_r | rc_r | rc_r | rc_r | rc_r | rc_r | rc_r | rc_r | rc_r |

Bits 31:16 Reserved, must be kept at reset value.

Bit 15 **MFCO**: Overflow status of the MFC Counter

When this bit is set then the MFC counter does not get incremented further. The bit gets cleared when this register is read.

Bits 14:11 Reserved, must be kept at reset value.

Bits 10:0 **MFC[10:0]**: Dropped Packet Counters

This counter indicates the number of packet counters that are dropped by the DMA either because of bus error or because of programming RPF field in *Channel receive control register (ETH_DMARXCR)*. The counter gets cleared when this register is read.

58.11.3 Ethernet MTL registers

Operating mode Register (ETH_MTLOMR)

Address offset: 0x0C00

Reset value: 0x0000 0000

The Operating Mode register establishes the Transmit and Receive operating modes and commands.

| | | | | | | | | | | | | | | | |

| | | | | | | rw | rw | | | | | | | rw | |

Bits 31:10 Reserved, must be kept at reset value.

Bit 9 **CNTCLR**: Counters Reset

When this bit is set, all counters are reset. This bit is cleared automatically after 1 clock cycle. If this bit is set along with CNTPRST bit, CNTPRST has precedence.

Bit 8 **CNTPRST**: Counters Preset

When this bit is set:

- [Tx queue underflow register \(ETH_MTLTXQUR\)](#) is initialized/preset to 0x7F0.
- Missed Packet and Overflow Packet counters in [Rx queue missed packet and overflow counter register \(ETH_MTLRXQMPOCR\)](#) is initialized/preset to 0x7F0

This bit is cleared automatically.

Bit 7 Reserved, must be kept at reset value.

Bits 6:2 Reserved, must be kept at reset value.

Bit 1 **DTXSTS**: Drop Transmit Status

When this bit is set, the Tx packet status received from the MAC is dropped in the MTL. When this bit is reset, the Tx packet status received from the MAC is forwarded to the application.

Bit 0 Reserved, must be kept at reset value.

Interrupt status Register (ETH_MTLISR)

Address offset: 0x0C20

Reset value: 0x0000 0000

The software driver (application) reads this register during interrupt service routine or polling to determine the interrupt status of MTL queues and the MAC.

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | | | | | | | | | | r |

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **Q0IS**: Queue interrupt status

This bit indicates that an interrupt has been generated by Queue. To reset this bit, read ETH_MTLQICSR register to identify the interrupt cause and clear the source.

Tx queue operating mode Register (ETH_MTLTXQOMR)

Address offset: 0x0D00

Reset value: 0x0007 0008

The Queue Transmit Operating Mode register establishes the Transmit queue operating modes and commands.

| | | | | | | | | | | | | | | | |

| | | | | | | | | | rw | rw | rw | r | r | rw | rw |

Bits 31:19 Reserved, must be kept at reset value.

Bits 18:16 **TQS[2:0]**: Transmit queue size

This field indicates the size of the allocated transmit queues in blocks of 256 bytes. Queue size range from 256 bytes (TQS=0b000) to 2048 bytes (TQS=0b111).

Bits 15:7 Reserved, must be kept at reset value.

Bits 6:4 **TTC[2:0]**: Transmit Threshold Control

These bits control the threshold level of the MTL Tx queue. The transmission starts when the packet size within the MTL Tx queue is larger than the threshold. In addition, full packets with length less than the threshold are also transmitted. These bits are used only when the TSF bit is reset.

- 000: 32
- 001: 64
- 010: 96
- 011: 128
- 100: 192
- 101: 256
- 110: 384
- 111: 512

Bits 3:2 **TXQEN[1:0]**: Transmit Queue Enable

This field is used to enable/disable the transmit queue .

- 00: Not enabled
- 10: Enabled

Others: Reserved, must not be used.

Note: In multiple Tx queues configuration, all the queues are disabled by default. Enable the Tx queue by programming this field.

Bit 1 **TSF**: Transmit Store and Forward

When this bit is set, the transmission starts when a full packet resides in the MTL Tx queue. When this bit is set, the TTC values specified in Bits[6:4] of this register are ignored. This bit should be changed only when the transmission is stopped.

Bit 0 **FTQ**: Flush Transmit Queue

When this bit is set, the Tx queue controller logic is reset to its default values. Therefore, all the data in the Tx queue is lost or flushed. This bit is internally reset when the flushing operation is complete. Until this bit is reset, you should not write to the ETH_MTLTXQOMR register. The data which is already accepted by the MAC transmitter is not flushed. It is scheduled for transmission and results in underflow and runt packet transmission.

Note: The flush operation is complete only when the Tx queue is empty and the application has accepted the pending Tx Status of all transmitted packets. To complete this flush operation, the PHY Tx clock (eth_mii_tx_clk) should be active.

Tx queue underflow register (ETH_MTLTXQUR)

Address offset: 0x0D04

Reset value: 0x0000 0000

The Queue Underflow Counter register contains the counter for packets aborted because of Transmit queue underflow and packets missed because of Receive queue packet flush

| | | | | | | | | | | | | | | | |
|------|------|------|------|--------------|----------------|------|------|------|------|------|------|------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | rc_r | rc_r | rc_r | rc_r | rc_r | rc_r | rc_r | rc_r | rc_r | rc_r | rc_r | rc_r |

Bits 31:12 Reserved, must be kept at reset value.

Bit 11 **UFCNTOVF**: Overflow Bit for Underflow Packet Counter

This bit is set every time the Tx queue Underflow Packet Counter field overflows, that is, it has crossed the maximum count. In such a scenario, the overflow packet counter is reset to all-zeros and this bit indicates that the rollover happened.

Bits 10:0 **UFFRMCNT[10:0]**: Underflow Packet Counter

This field indicates the number of packets aborted by the controller because of Tx queue Underflow. This counter is incremented each time the MAC aborts outgoing packet because of underflow. The counter is cleared when this register is read.

Tx queue debug register (ETH_MTLTXQDR)

Address offset: 0x0D08

Reset value: 0x0000 0000

The Queue Transmit Debug register gives the debug status of various blocks related to the Transmit queue.

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|------|-------------|------------|---------|---------|-------------|----|------------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | | | | | r | r | r | r | r | r |

Bits 31:23 Reserved, must be kept at reset value.

Bits 22:20 **STXSTS[2:0]**: Number of Status Words in Tx Status FIFO of Queue

This field indicates the current number of status in the Tx Status FIFO of this queue. When the DTXSTS bit of ETH_MTLQMR register is set to 1, this field does not reflect the number of status words in Tx Status FIFO.

Bit 19 Reserved, must be kept at reset value.

Bits 18:16 **PTXQ[2:0]**: Number of Packets in the Transmit Queue

This field indicates the current number of packets in the Tx queue. When the DTXSTS bit of *Operating mode Register (ETH_MTLQMR)* register is set to 1, this field does not reflect the number of packets in the Transmit queue.

Bits 15:6 Reserved, must be kept at reset value.

Bit 5 **TXSTSFSTS**: MTL Tx Status FIFO Full Status

When high, this bit indicates that the MTL Tx Status FIFO is full. Therefore, the MTL cannot accept any more packets for transmission.

Bit 4 **TXQSTS**: MTL Tx Queue Not Empty Status

When this bit is high, it indicates that the MTL Tx queue is not empty and some data is left for transmission.

Bit 3 **TWCSTS**: MTL Tx Queue Write Controller Status

When high, this bit indicates that the MTL Tx queue Write Controller is active, and it is transferring the data to the Tx queue.

Bits 2:1 **TRCSTS[1:0]**: MTL Tx Queue Read Controller Status

This field indicates the state of the Tx Queue Read Controller:

- 00: Idle state
- 01: Read state (transferring data to the MAC transmitter)
- 10: Waiting for pending Tx Status from the MAC transmitter
- 11: Flushing the Tx queue because of the Packet Abort request from the MAC

Bit 0 **TXQPAUSED**: Transmit Queue in Pause

When this bit is high and the Rx flow control is enabled, it indicates that the Tx queue is in the Pause condition (in the Full-duplex only mode) because of the following:

- Reception of the PFC packet for the priorities assigned to the Tx queue when PFC is enabled
- Reception of 802.3x Pause packet when PFC is disabled

Queue interrupt control status Register (ETH_MTLQICSR)

Address offset: 0x0D2C

Reset value: 0x0000 0000

This register contains the interrupt enable and status bits for the queue interrupts.

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|-------|------|------|------|------|------|------|------|---------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | | rw | | | | | | | | rc_w1 |

Bits 31:25 Reserved, must be kept at reset value.

Bit 24 **RXOIE**: Receive Queue Overflow Interrupt Enable

When this bit is set, the Receive Queue Overflow interrupt is enabled. When this bit is reset, the Receive Queue Overflow interrupt is disabled.

Bits 23:17 Reserved, must be kept at reset value.

Bit 16 **RXOVFIS**: Receive Queue Overflow Interrupt Status

This bit indicates that the Receive Queue had an overflow while receiving the packet. If a partial packet is transferred to the application, the overflow status is set in RDES3[21]. This bit is cleared when the application writes 1 to this bit.

Bits 15:9 Reserved, must be kept at reset value.

Bit 8 **TXUIE**: Transmit Queue Underflow Interrupt Enable

When this bit is set, the Transmit Queue Underflow interrupt is enabled. When this bit is reset, the Transmit Queue Underflow interrupt is disabled.

Bits 7:1 Reserved, must be kept at reset value.

Bit 0 **TXUNFIS**: Transmit Queue Underflow Interrupt Status

This bit indicates that the Transmit Queue had an underflow while transmitting the packet. Transmission is suspended and an Underflow Error TDES3[2] is set. This bit is cleared when the application writes 1 to this bit.

Rx queue operating mode register (ETH_MTLRXQOMR)

Address offset: 0x0D30

Reset value: 0x0070 0000

The Queue Receive operating Mode register establishes the Receive queue operating modes and command.

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|------|------------|-----|-----|------|------|----------|------|

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | DIS_TCP_EF | RSF | FEP | FUP | Res. | RTC[1:0] | |
| | | | | | | | | | rw | rw | rw | rw | | rw | rw |

Bits 31:23 Reserved, must be kept at reset value.

Bits 22:20 **RQS[2:0]**: Receive Queue Size

This field is read-only and the configured Rx FIFO size in blocks of 256 bytes is reflected in the reset value. The size of the Queue is (RQS + 1) * 256 bytes.

Bits 19:7 Reserved, must be kept at reset value.

Bit 6 **DIS_TCP_EF**: Disable Dropping of TCP/IP Checksum Error Packets

When this bit is set, the MAC does not drop the packets which only have the errors detected by the Receive Checksum Offload engine. Such packets have errors only in the encapsulated payload. There are no errors (including FCS error) in the Ethernet packet received by the MAC.

When this bit is reset, all error packets are dropped if the FEP bit is reset.

Bit 5 **RSF**: Receive Queue Store and Forward

When this bit is set, the Ethernet peripheral reads a packet from the Rx queue only after the complete packet has been written to it, ignoring the RTC field of this register. When this bit is reset, the Rx queue operates in the Threshold (cut-through) mode, subject to the threshold specified by the RTC field of this register.

Bit 4 **FEP**: Forward Error Packets

When this bit is reset, the Rx queue drops packets with error status (CRC error, receive error, watchdog timeout, or overflow). However, if the start byte (write) pointer of a packet is already transferred to the read controller side (in Threshold mode), the packet is not dropped.

When this bit is set, all packets except the runt error packets are forwarded to the application or DMA. If the RSF bit is set and the Rx queue overflows when a partial packet is written, the packet is dropped irrespective of the setting of this bit. However, if the RSF bit is reset and the Rx queue overflows when a partial packet is written, a partial packet may be forwarded to the application or DMA.

Bit 3 **FUP**: Forward Undersized Good Packets

When this bit is set, the Rx queue forwards the undersized good packets (packets with no error and length less than 64 bytes), including pad-bytes and CRC. When this bit is reset, the Rx queue drops all packets of less than 64 bytes, unless a packet is already transferred because of the lower value of Rx Threshold, for example, RTC = 01.

Bit 2 Reserved, must be kept at reset value.

Bits 1:0 **RTC[1:0]**: Receive Queue Threshold Control

These bits control the threshold level of the MTL Rx queue (in bytes):

00: 64

01: 32

10: 96

11: 128

The received packet is transferred to the application or DMA when the packet size within the MTL Rx queue is larger than the threshold. In addition, full packets with length less than the threshold are automatically transferred.

This field is valid only when the RSF bit is zero. This field is ignored when the RSF bit is set to 1.

Rx queue missed packet and overflow counter register (ETH_MTLRXQMPOCR)

Address offset: 0x0D34

Reset value: 0x0000 0000

The Queue missed packet and overflow counter registers contain the counter for packets missed because of Receive queue packet flush and packets discarded because of Receive queue overflow.

| | | | | | | | | | | | | | | | |

Bits 31:28 Reserved, must be kept at reset value.

Bit 27 **MISCNTOVF**: Missed Packet Counter Overflow Bit

When set, this bit indicates that the Rx Queue Missed Packet Counter crossed the maximum limit.

Bits 26:16 **MISPKTCNT[10:0]**: Missed Packet Counter

This field indicates the number of packets missed by the Ethernet peripheral because the application requested to flush the packets for this queue. This counter is reset when this register is read.

This counter is incremented by 1 when the DMA discards the packet because of buffer unavailability.

Bits 15:12 Reserved, must be kept at reset value.

Bit 11 **OVFCNTOVF**: Overflow Counter Overflow Bit

When set, this bit indicates that the Rx Queue Overflow Packet Counter field crossed the maximum limit.

Bits 10:0 **OVFPKTCNT[10:0]**: Overflow Packet Counter

This field indicates the number of packets discarded by the Ethernet peripheral because of Receive queue overflow. This counter is incremented each time the Ethernet peripheral discards an incoming packet because of overflow. This counter is reset when this register is read.

Rx queue debug register (ETH_MTLRXQDR)

Address offset: 0x0D38

Reset value: 0x0000 0000

The Queue Receive Debug register gives the debug status of various blocks related to the Receive queue.

| | | | | | | | | | | | | | | | |

| | | | | | | | | | | r | r | | r | r | r |

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:16 **PRXQ[13:0]**: Number of Packets in Receive Queue

This field indicates the current number of packets in the Rx queue. The theoretical maximum value for this field is 256Kbyte/16bytes = 16K Packets, that is, Max_Queue_Size/Min_Packet_Size.

Bits 15:6 Reserved, must be kept at reset value.

Bits 5:4 **RXQSTS[1:0]**: MTL Rx Queue Fill-Level Status

This field gives the status of the fill-level of the Rx queue:
 00: Rx queue empty
 01: Rx queue fill-level below flow-control deactivate threshold
 10: Rx queue fill-level above flow-control activate threshold
 11: Rx queue full

Bit 3 Reserved, must be kept at reset value.

Bits 2:1 **RRCSTS[1:0]**: MTL Rx Queue Read Controller State

This field gives the state of the Rx queue Read controller:
 00: Idle state
 01: Reading packet data
 10: Reading packet status (or timestamp)
 11: Flushing the packet data and status

Bit 0 **RWCSTS**: MTL Rx Queue Write Controller Active Status

When high, this bit indicates that the MTL Rx queue Write controller is active, and it is transferring a received packet to the Rx queue.

Refer to [Section 2.3 on page 129](#) for the register boundary addresses.

58.11.4 Ethernet MAC and MMC registers

Operating mode configuration register (ETH_MACCR)

Address offset: 0x0000

Reset value: 0x0000 0000

The MAC Configuration Register establishes the operating mode of the MAC.

Bit 31 ARPEN: ARP Offload Enable

When this bit is set, the MAC can recognize an incoming ARP request packet and schedules the ARP packet for transmission. It forwards the ARP packet to the application and also indicate the events in the RxStatus.

When this bit is reset, the MAC receiver does not recognize any ARP packet and indicates them as Type frame in the RxStatus.

Bits 30:28 SARC[2:0]: Source Address Insertion or Replacement Control

This field controls the source address insertion or replacement for all transmitted packets. Bit 30 specifies which MAC Address register (0 or 1) is used for source address insertion or replacement based on the values of Bits[29:28]:

010: the MAC inserts the content of the MAC Address 0 registers ([MAC Address 0 high register \(ETH_MACA0HR\)](#) and [MAC Address x low register \(ETH_MACAxLR\)](#)) in the SA field of all transmitted packets.

011: the MAC replaces the content of the MAC Address 0 registers ([MAC Address 0 high register \(ETH_MACA0HR\)](#) and [MAC Address x low register \(ETH_MACAxLR\)](#)) in the SA field of all transmitted packets.

110: the MAC inserts the content of the MAC Address 1 registers ([MAC Address x high register \(ETH_MACAxHR\)](#) and [MAC Address x low register \(ETH_MACAxLR\)](#)) in the SA field of all transmitted packets

111: the MAC replaces the content of the MAC Address 1 registers ([MAC Address x high register \(ETH_MACAxHR\)](#) and [MAC Address x low register \(ETH_MACAxLR\)](#)) in the SA field of all transmitted packets.

Others: Reserved, must not be used.

Note: Changes to this field take effect only on the start of a packet. If you write to this register field when a packet is being transmitted, only the subsequent packet can use the updated value, that is, the current packet does not use the updated value.

Bit 27 IPC: Checksum Offload

When set, this bit enables the IPv4 header checksum checking and IPv4 or IPv6 TCP, UDP, or ICMP payload checksum checking. When this bit is reset, the COE function in the receiver is disabled.

The Layer 3 and Layer 4 Packet Filter feature automatically selects the IPC Full Checksum Offload Engine on the Receive side. When this feature is enabled, you must set the IPC bit.

Bits 26:24 IPG[2:0]: Inter-Packet Gap

These bits control the minimum IPG between packets during transmission.

000: 96 bit times

001: 88 bit times

010: 80 bit times

...

111: 40 bit times

This range of minimum IPG is valid in Full-duplex mode.

In the Half-duplex mode, the minimum IPG can be configured only for 64-bit times (IPG = 100). Lower values are not considered.

When a JAM pattern is being transmitted because of backpressure activation, the MAC does not consider the minimum IPG.

The above function (IPG less than 96 bit times) is valid only when EIPGEN bit in ETH_MACECR register is reset. When EIPGEN is set, then the minimum IPG (greater than 96 bit times) is controlled as per the description given in EIPG field in ETH_MACECR register.

Bit 23 GPSLCE: Giant Packet Size Limit Control Enable

When this bit is set, the MAC considers the value in GPSL field in ETH_MACECR register to declare a received packet as Giant packet. This field must be programmed to more than 1,518 bytes. Otherwise, the MAC considers 1,518 bytes as giant packet limit.

When this bit is reset, the MAC considers a received packet as Giant packet when its size is greater than 1,518 bytes (1522 bytes for tagged packet).

The watchdog timeout limit, Jumbo Packet Enable and 2K Packet Enable have higher precedence over this bit, that is the MAC considers a received packet as Giant packet when its size is greater than 9,018 bytes (9,022 bytes for tagged packet) with Jumbo Packet Enabled and greater than 2,000 bytes with 2K Packet Enabled. The watchdog timeout, if enabled, terminates the received packet when watchdog limit is reached. Therefore, the programmed giant packet limit should be less than the watchdog limit to get the giant packet status.

Bit 22 S2KP: IEEE 802.3as Support for 2K Packets

When this bit is set, the MAC considers all packets with up to 2,000 bytes length as normal packets. When the JE bit is not set, the MAC considers all received packets of size more than 2K bytes as Giant packets.

When this bit is reset and the JE bit is not set, the MAC considers all received packets of size more than 1,518 bytes (1,522 bytes for tagged) as giant packets. For more information about how the setting of this bit and the JE bit impact the Giant packet status, see [Table 585: Giant Packet Status based on S2KP and JE Bits](#).

Note: When the JE bit is set, setting this bit has no effect on the giant packet status.

Bit 21 CST: CRC stripping for Type packets

When this bit is set, the last four bytes (FCS) of all packets of Ether type (type field greater than 1,536) are stripped and dropped before forwarding the packet to the application. This function is not valid when the IP Checksum Engine (Type 1) is enabled in the MAC receiver. This function is valid when Type 2 Checksum Offload Engine is enabled.

Note: For information about how the settings of the ACS bit and this bit impact the packet length, see [Table 586: Packet Length based on the CST and ACS bits](#).

- Bit 20 **ACS**: Automatic Pad or CRC Stripping
- When this bit is set, the MAC strips the Pad or FCS field on the incoming packets only if the value of the length field is less than 1,536 bytes. All received packets with length field greater than or equal to 1,536 bytes are passed to the application without stripping the Pad or FCS field.
- When this bit is reset, the MAC passes all incoming packets to the application, without any modification.
- Note: For information about how the settings of CST bit and this bit impact the packet length, see [Table 586: Packet Length based on the CST and ACS bits](#).*
- Bit 19 **WD**: Watchdog Disable
- When this bit is set, the MAC disables the watchdog timer on the receiver. The MAC can receive packets of up to 16,383 bytes.
- When this bit is reset, the MAC does not allow more than 2,048 bytes (10,240 if JE is set high) of the packet being received. The MAC cuts off any bytes received after 2,048 bytes.
- Bit 18 Reserved, must be kept at reset value.
- Bit 17 **JD**: Jabber Disable
- When this bit is set, the MAC disables the jabber timer on the transmitter. The MAC can transfer packets of up to 16,383 bytes.
- When this bit is reset, if the application sends more than 2,048 bytes of data (10,240 if JE is set high) during transmission, the MAC does not send rest of the bytes in that packet.
- Bit 16 **JE**: Jumbo Packet Enable
- When this bit is set, the MAC allows jumbo packets of 9,018 bytes (9,022 bytes for VLAN tagged packets) without reporting a giant packet error in the Rx packet status.
- For more information about how the setting of this bit and the JE bit impact the Giant packet status, see [Table 585: Giant Packet Status based on S2KP and JE Bits](#).
- Bit 15 Reserved, must be kept at reset value.
- Bit 14 **FES**: MAC Speed
- This bit selects the speed in the 10/100 Mbps mode:
- 0: 10 Mbps
 - 1: 100 Mbps
- Bit 13 **DM**: Duplex Mode
- When this bit is set, the MAC operates in the Full-duplex mode in which it can transmit and receive simultaneously.
- Bit 12 **LM**: Loopback Mode
- When this bit is set, the MAC operates in the loopback mode at MII. The MII Rx clock input (eth_mii_rx_clk) is required for the loopback to work properly. This is because the Tx clock is not internally looped back.
- Bit 11 **ECRSFD**: Enable Carrier Sense Before Transmission in Full-duplex mode
- When this bit is set, the MAC transmitter checks the CRS signal before packet transmission in the Full-duplex mode. The MAC starts the transmission only when the CRS signal is low.
- When this bit is reset, the MAC transmitter ignores the status of the CRS signal.
- Bit 10 **DO**: Disable Receive Own
- When this bit is set, the MAC disables the reception of packets when the ETH_TX_EN is asserted in the Half-duplex mode. When this bit is reset, the MAC receives all packets given by the PHY.
- This bit is not applicable in the Full-duplex mode. This bit is reserved and read-only (RO) with default value in the Full-duplex-only configurations.

Bit 9 DCRS: Disable Carrier Sense During Transmission

When this bit is set, the MAC transmitter ignores the MII CRS signal during packet transmission in the Half-duplex mode. As a result, no errors are generated because of Loss of Carrier or No Carrier during transmission.

When this bit is reset, the MAC transmitter generates errors because of Carrier Sense. The MAC can even abort the transmission.

Bit 8 DR: Disable Retry

When this bit is set, the MAC attempts only one transmission. When a collision occurs on the MII interface, the MAC ignores the current packet transmission and reports a Packet Abort with excessive collision error in the Tx packet status.

When this bit is reset, the MAC retries based on the settings of the BL field. This bit is applicable only in the Half-duplex mode.

Bit 7 Reserved, must be kept at reset value.**Bits 6:5 BL[1:0]:** Back-Off Limit

The back-off limit determines the random integer number (r) of slot time delays (512 bit times for 10/100 Mbps) for which the MAC waits before rescheduling a transmission attempt during retries after a collision:

00: $k = \min(n, 10)$

01: $k = \min(n, 8)$

10: $k = \min(n, 4)$

11: $k = \min(n, 1)$

where n = retransmission attempt

The random integer r takes the value in the range $0 \leq r < 2^k$.

This bit is applicable only in the Half-duplex mode.

Bit 4 DC: Deferral Check

When this bit is set, the deferral check function is enabled in the MAC. The MAC issues a Packet Abort status, along with the excessive deferral error bit set in the Tx packet status, when the Tx state machine is deferred for more than 24,288 bit times in 10 or 100 Mbps mode.

Deferral begins when the transmitter is ready to transmit, but it is prevented because of an active carrier sense signal (CRS) on MII.

The defer time is not cumulative. For example, if the transmitter defers for 10,000 bit times because the CRS signal is active and the CRS signal becomes inactive, the transmitter transmits and collision happens. Because of collision, the transmitter needs to back off and then defer again after back off completion. In such a scenario, the deferral timer is reset to 0, and it is restarted.

When this bit is reset, the deferral check function is disabled and the MAC defers until the CRS signal goes inactive.

This bit is applicable only in the Half-duplex mode.

Bits 3:2 PRELEN[1:0]: Preamble Length for Transmit packets

These bits control the number of preamble bytes that are added to the beginning of every Tx packet. The preamble reduction occurs only when the MAC is operating in the Full-duplex mode.

00: 7 bytes of preamble

01: 5 bytes of preamble

10: 3 bytes of preamble

11: Reserved, must not be used

Bit 1 **TE**: Transmitter Enable

When this bit is set, the Tx state machine of the MAC is enabled for transmission on the MII interface. When this bit is reset, the MAC Tx state machine is disabled after it completes the transmission of the current packet. The Tx state machine does not transmit any more packets.

Bit 0 **RE**: Receiver Enable

When this bit is set, the Rx state machine of the MAC is enabled for receiving packets from the MII interface. When this bit is reset, the MAC Rx state machine is disabled after it completes the reception of the current packet. The Rx state machine does not receive any more packets from the MII interface.

[Table 585](#) shows how the settings of S2KP and JE bits of the ETH_MACCCR register impact the giant packet status.

Table 585. Giant Packet Status based on S2KP and JE Bits⁽¹⁾

| Length/Type Field | Received Packet Length | S2KP | JE | Giant Packet Status |
|--------------------|------------------------|------|----|---------------------|
| Untagged packet | > 1,518 | 0 | 0 | 1 |
| | > 2,000 | 1 | 0 | 1 |
| | > 9,018 | x | 1 | 1 |
| VLAN tagged packet | > 1,522 | 0 | 0 | 1 |
| | > 2,000 | 1 | 0 | 1 |
| | > 9,022 | x | 1 | 1 |

1. For all other combinations, the Giant Packet status is 0.

[Table 586](#) shows how the settings of the CST and ACS bits of the ETH_MACCCR register impact whether CRC length is included in the packet length.

Table 586. Packet Length based on the CST and ACS bits

| Received Packet Length | CST | ACS | FCS Stripping Done |
|------------------------|-----|-----|----------------------------|
| < 1,536 | x | 0 | No |
| | x | 1 | Yes (for Ethernet packets) |
| ≥ 1,536 | 0 | x | No |
| | 1 | x | Yes (for Type packets) |

Extended operating mode configuration register (ETH_MACECR)

Address offset: 0x0004

Reset value: 0x0000 0000

The MAC Extended Configuration Register establishes the operating mode of the MAC.

| | | | | | | | | | | | | | | | |
|------|------|------------|----|----|----|--------|------|------|------|------|------|------|-----|------|-------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | rw | rw | rw | rw | rw | | | | | | | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | GFSL[13:0] | | | | | | | | | | | | | |
| | | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:25 **EIPG[4:0]**: Extended Inter-Packet Gap

The value in this field is applicable when the EIPGEN bit is set. This field (as Most Significant bits) along with IPG field in *Operating mode configuration register (ETH_MACCCR)*, gives the minimum IPG greater than 96 bit times in steps of 8 bit times. For example:

- EIPG = 0 and IPG = 0 give 104 bit times
- EIPG = 0 and IPG = 1 give 112 bit times
- EIPG = 0 and IPG = 2 give 120 bit times
- ..
- EIPG = 7 and IPG = 31 give 2144 bit times

Bit 24 **EIPGEN**: Extended Inter-Packet Gap Enable

When this bit is set, the MAC interprets EIPG field and IPG field in *Operating mode configuration register (ETH_MACCCR)* together as minimum IPG greater than 96 bit times in steps of 8 bit times.

When this bit is reset, the MAC ignores EIPG field and interprets IPG field in *Operating mode configuration register (ETH_MACCCR)* as minimum IPG less than or equal to 96 bit times in steps of 8 bit times.

Note: The extended Inter-Packet Gap feature must be enabled when operating in Full-duplex mode only. There may be undesirable effects on back-pressure function and frame transmission if it is enabled in Half-duplex mode.

Bits 23:19 Reserved, must be kept at reset value.

Bit 18 **USP**: Unicast Slow Protocol Packet Detect

When this bit is set, the MAC detects the Slow Protocol packets with unicast address of the station specified in the *MAC Address 0 high register (ETH_MACA0HR)* and MAC Address 0 low register *MAC Address x low register (ETH_MACAxLR)*. The MAC also detects the Slow Protocol packets with the Slow Protocols multicast address (01-80-C2-00-00-02).

When this bit is reset, the MAC detects only Slow Protocol packets with the Slow Protocol multicast address specified in the IEEE 802.3-2008, Section 5.

Bit 17 **SPEN**: Slow Protocol Detection Enable

When this bit is set, MAC processes the Slow Protocol packets (Ether Type 0x8809) and provides the Rx status. The MAC discards the Slow Protocol packets with invalid subtypes. When this bit is reset, the MAC forwards all error-free Slow Protocol packets to the application. The MAC considers such packets as normal Type packets.

Bit 16 **DCRCC**: Disable CRC Checking for Received Packets

When this bit is set, the MAC receiver does not check the CRC field in the received packets. When this bit is reset, the MAC receiver always checks the CRC field in the received packets.

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:0 **GPSL[13:0]**: Giant Packet Size Limit

If the received packet size is greater than the value programmed in this field in units of bytes, the MAC declares the received packet as Giant packet. The value programmed in this field must be greater than or equal to 1,518 bytes. Any other programmed value is considered as 1,518 bytes.

For VLAN tagged packets, the MAC adds 4 bytes to the programmed value. For double VLAN tagged packets, the MAC adds 8 bytes to the programmed value. The value in this field is applicable when the GPSLCE bit is set in ETH_MACCR register.

Packet filtering control register (ETH_MACPFR)

Address offset: 0x0008

Reset value: 0x0000 0000

The MAC Packet Filter register contains the filter controls for receiving packets. Some of the controls from this register go to the address check block of the MAC which performs the first level of address filtering. The second level of filtering is performed on the incoming packet based on other controls such as Pass Bad Packets and Pass Control Packets.

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|----------|------|------|------|------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w |

Bit 31 **RA**: Receive All

When this bit is set, the MAC Receiver module passes all received packets to the application, irrespective of whether they pass the address filter or not. The result of the SA or DA filtering is updated (pass or fail) in the corresponding bit in the Rx Status Word.

When this bit is reset, the Receiver module passes only those packets to the application that pass the SA or DA address filter.

Bits 30:22 Reserved, must be kept at reset value.

Bit 21 **DNTU**: Drop Non-TCP/UDP over IP Packets

When this bit is set, the MAC drops the non-TCP or UDP over IP packets. The MAC forward only those packets that are processed by the Layer 4 filter. When this bit is reset, the MAC forwards all non-TCP or UDP over IP packets.

- Bit 20 **IPFE**: Layer 3 and Layer 4 Filter Enable
When this bit is set, the MAC drops packets that do not match the enabled Layer 3 and Layer 4 filters. If Layer 3 or Layer 4 filters are not enabled for matching, this bit does not have any effect.
When this bit is reset, the MAC forwards all packets irrespective of the match status of the Layer 3 and Layer 4 fields.
- Bits 19:17 Reserved, must be kept at reset value.
- Bit 16 **VTFE**: VLAN Tag Filter Enable
When this bit is set, the MAC drops the VLAN tagged packets that do not match the VLAN Tag. When this bit is reset, the MAC forwards all packets irrespective of the match status of the VLAN Tag.
- Bits 15:11 Reserved, must be kept at reset value.
- Bit 10 **HPF**: Hash or Perfect Filter
When this bit is set, the address filter passes a packet if it matches either the perfect filtering or Hash filtering as set by the HMC or HUC bit.
When this bit is reset and the HUC or HMC bit is set, the packet is passed only if it matches the Hash filter.
- Bit 9 **SAF**: Source Address Filter Enable
When this bit is set, the MAC compares the SA field of the received packets with the values programmed in the enabled SA registers. If the comparison fails, the MAC drops the packet. When this bit is reset, the MAC forwards the received packet to the application with updated SAF bit of the Rx Status depending on the SA address comparison.
Note: According to the IEEE specification, Bit 47 of the SA is reserved. However, the MAC compares all 48 bits. The software driver should take this into consideration while programming the MAC address registers for SA.
- Bit 8 **SAIF**: SA Inverse Filtering
When this bit is set, the Address Check block operates in the inverse filtering mode for SA address comparison. If the SA of a packet matches the values programmed in the SA registers, it is marked as failing the SA Address filter.
When this bit is reset, if the SA of a packet does not match the values programmed in the SA registers, it is marked as failing the SA Address filter.
- Bits 7:6 **PCF[1:0]**: Pass Control Packets
These bits control the forwarding of all control packets (including unicast and multicast Pause packets).
00: The MAC filters all control packets from reaching the application.
01: The MAC forwards all control packets except Pause packets to the application even if they fail the Address filter.
10: The MAC forwards all control packets to the application even if they fail the Address filter.
11: The MAC forwards the control packets that pass the Address filter.
- Bit 5 **DBF**: Disable Broadcast Packets
When this bit is set, the AFM module blocks all incoming broadcast packets. In addition, it overrides all other filter settings.
When this bit is reset, the AFM module passes all received broadcast packets.
- Bit 4 **PM**: Pass All Multicast
When this bit is set, it indicates that all received packets with a multicast destination address (first bit in the destination address field is '1') are passed. When this bit is reset, filtering of multicast packet depends on HMC bit.

Bit 3 **DAIF**: DA Inverse Filtering

When this bit is set, the Address Check block operates in inverse filtering mode for the DA address comparison for both unicast and multicast packets. When this bit is reset, normal filtering of packets is performed.

Bit 2 **HMC**: Hash Multicast

When this bit is set, the MAC performs the destination address filtering of received multicast packets according to the Hash table.

When this bit is reset, the MAC performs the perfect destination address filtering for multicast packets, that is, it compares the DA field with the values programmed in DA registers.

Bit 1 **HUC**: Hash Unicast

When this bit is set, the MAC performs the destination address filtering of unicast packets according to the Hash table.

When this bit is reset, the MAC performs a perfect destination address filtering for unicast packets, that is, it compares the DA field with the values programmed in DA registers.

Bit 0 **PR**: Promiscuous Mode

When this bit is set, the Address Filtering module passes all incoming packets irrespective of the destination or source address. The SA or DA Filter Fails status bits of the Rx Status Word are always cleared when PR is set.

Watchdog timeout register (ETH_MACWTR)

Address offset: 0x000C

Reset value: 0x0000 0000

The Watchdog Timeout register controls the watchdog timeout for received packets.

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|------|------|------|------|----------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | PWE | Res. | Res. | Res. | Res. | WTO[3:0] | | | |
| | | | | | | | rw | | | | | rw | rw | rw | rw |

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **PWE**: Programmable Watchdog Enable

When this bit is set and the WD bit of the *Operating mode configuration register (ETH_MACCCR)* register is reset, the WTO field is used as watchdog timeout for a received packet. When this bit is cleared, the watchdog timeout for a received packet is controlled by setting of WD and JE bits in *Operating mode configuration register (ETH_MACCCR)* register.

Bits 7:4 Reserved, must be kept at reset value.

Bits 3:0 **WTO[3:0]**: Watchdog Timeout

When the PWE bit is set and the WD bit of the *Operating mode configuration register (ETH_MACCCR)* register is reset, this field is used as watchdog timeout for a received packet. If the length of a received packet exceeds the value of this field, such packet is terminated and declared as an error packet.

Encoding is as follows:

0x0: 2 Kbytes

0x1: 3 Kbytes

0x2: 4 Kbytes

0x3: 5 Kbytes

..

0xC: 14 Kbytes

0xD: 15 Kbytes

0xE: 16383 Bytes

0xF: Reserved, must not be used

Note: When the PWE bit is set, the value in this field should be more than 1,522 (0x05F2). Otherwise, the IEEE 802.3-specified valid tagged packets are declared as error packets and then dropped.

Hash Table 0 register (ETH_MACHT0R)

Address offset: 0x0010

Reset value: 0x0000 0000

The Hash Table Register 0 contains the first lower 32 bits of the Hash table (64 bits).

The Hash table is used for group address filtering.

For Hash filtering, the content of the destination address in the incoming packet is passed through the CRC logic and the upper six bits of the CRC register are used to index the content of the Hash table. The most significant bits determines the register to be used (Hash Table Register 0 or 1) and the least significant five bits determine the bit within the register. For example, a hash value of 0b100000 selects Bit 0 of the Hash Table Register 1.

The Hash value of the destination address is calculated in the following way:

1. Calculate the 32-bit CRC for the DA (See IEEE 802.3, Section 3.2.8 for the steps to calculate CRC32).
2. Perform bitwise reversal for the value obtained in Step 1.
3. Take the upper 7 or 8 bits from the value obtained in Step 2.

If the corresponding bit value of the register is 1, the packet is accepted. Otherwise, it is rejected. If the PM bit is set in ETH_MACPFR, all multicast packets are accepted regardless of the multicast Hash values.

Bits 31:0 **HT31T0[31:0]**: MAC Hash Table First 32 Bits
 This field contains the first 32 Bits [31:0] of the Hash table.

Hash Table 1 register (ETH_MACHT1R)

Address offset: 0x0014

Reset value: 0x0000 0000

The Hash Table 1 register contains the upper 32 bits of the Hash table (64 bits).

The Hash table is used for group address filtering.

For Hash filtering, the content of the destination address in the incoming packet is passed through the CRC logic and the upper six bits of the CRC register are used to index the content of the Hash table. The most significant bits determines the register to be used (Hash Table Register 0 or 1) and the least significant five bits determine the bit within the register. For example, a hash value of 6'b100000 selects Bit 0 of the Hash Table Register 1.

The Hash value of the destination address is calculated in the following way:

1. Calculate the 32-bit CRC for the DA (See IEEE 802.3, Section 3.2.8 for the steps to calculate CRC32).
2. Perform bitwise reversal for the value obtained in Step 1.
3. Take the upper 7 or 8 bits from the value obtained in Step 2.

If the corresponding bit value of the register is 1, the packet is accepted. Otherwise, it is rejected. If the PM bit is set in ETH_MACPFR, all multicast packets are accepted regardless of the multicast Hash values.

- Bit 31 EIVLRXS:** Enable Inner VLAN Tag in Rx Status
 When this bit is set, the MAC provides the inner VLAN Tag in the Rx status. When this bit is reset, the MAC does not provide the inner VLAN Tag in Rx status.
- Bit 30** Reserved, must be kept at reset value.
- Bits 29:28 EIVLS[1:0]:** Enable Inner VLAN Tag Stripping on Receive
 This field indicates the stripping operation on inner VLAN Tag in received packet:
 00: Do not strip
 01: Strip if VLAN filter passes
 10: Strip if VLAN filter fails
 11: Always strip
- Bit 27 ERIVLT:** Enable Inner VLAN Tag
 When this bit and the EDVLP field are set, the MAC receiver enables operation on the inner VLAN Tag (if present). When this bit is reset, the MAC receiver enables operation on the outer VLAN Tag (if present). The ERSVLM bit determines which VLAN type is enabled for filtering or matching. The ERSVLM bit and DOVLT bit determines which VLAN type is enabled for filtering.
- Bit 26 EDVLP:** Enable Double VLAN Processing
 When this bit is set, the MAC enables processing of up to two VLAN Tags on Tx and Rx (if present). When this bit is reset, the MAC enables processing of up to one VLAN Tag on Tx and Rx (if present).
- Bit 25 VTHM:** VLAN Tag Hash Table Match Enable
 When this bit is set, the most significant four bits of CRC of VLAN Tag are used to index the content of the ETH_MACVLANHTR register. A value of 1 in the VLAN Hash Table register, corresponding to the index, indicates that the packet matched the VLAN Hash table.
 When the ETV bit is set, the CRC of the 12-bit VLAN Identifier (VID) is used for comparison. When the ETV bit is reset, the CRC of the 16-bit VLAN tag is used for comparison.
 When this bit is reset, the VLAN Hash Match operation is not performed.
- Bit 24 EVLRXS:** Enable VLAN Tag in Rx status
 When this bit is set, MAC provides the outer VLAN Tag in the Rx status. When this bit is reset, the MAC does not provide the outer VLAN Tag in Rx status.
- Bit 23** Reserved, must be kept at reset value.

- Bits 22:21 **EVLS[1:0]**: Enable VLAN Tag Stripping on Receive
This field indicates the stripping operation on the outer VLAN Tag in received packet:
00: Do not strip
01: Strip if VLAN filter passes
10: Strip if VLAN filter fails
11: Always strip
- Bit 20 **DOVLTC**: Disable VLAN Type Check
When this bit is set, the MAC does not check whether the VLAN Tag specified by the ERIVLT bit is of type S-VLAN or C-VLAN.
When this bit is reset, the MAC filters or matches the VLAN Tag specified by the ERIVLT bit only when VLAN Tag type is similar to the one specified by the ERSVLM bit.
- Bit 19 **ERSVLM**: Enable Receive S-VLAN Match
When this bit is set, the MAC receiver enables filtering or matching for S-VLAN (Type = 0x88A8) packets. When this bit is reset, the MAC receiver enables filtering or matching for C-VLAN (Type = 0x8100) packets.
The ERIVLT bit determines the VLAN tag position considered for filtering or matching.
- Bit 18 **ESVL**: Enable S-VLAN
When this bit is set, the MAC transmitter and receiver consider the S-VLAN packets (Type = 0x88A8) as valid VLAN tagged packets.
- Bit 17 **VTIM**: VLAN Tag Inverse Match Enable
When this bit is set, this bit enables the VLAN Tag inverse matching. The packets without matching VLAN Tag are marked as matched. When reset, this bit enables the VLAN Tag perfect matching. The packets with matched VLAN Tag are marked as matched.
- Bit 16 **ETV**: Enable 12-Bit VLAN Tag Comparison
When this bit is set, a 12-bit VLAN identifier is used for comparing and filtering instead of the complete 16-bit VLAN tag. Bits[11:0] of VLAN tag are compared with the corresponding field in the received VLAN-tagged packet. Similarly, when enabled, only 12 bits of the VLAN tag in the received packet are used for Hash-based VLAN filtering.
When this bit is reset, all 16 bits of the 15th and 16th bytes of the received VLAN packet are used for comparison and VLAN Hash filtering.
- Bits 15:0 **VL[15:0]**: VLAN Tag Identifier for Receive Packets
This field contains the 802.1Q VLAN tag to identify the VLAN packets. This VLAN tag identifier is compared to the 15th and 16th bytes of the packets being received for VLAN packets. The following list describes the bits of this field:
Bits[15:13]: User Priority
Bit 12: Canonical Format Indicator (CFI) or Drop Eligible Indicator (DEI)
Bits[11:0]: VLAN Identifier (VID) field of VLAN tag
When the ETV bit is set, only the VID is used for comparison.
If this field ([11:0] if ETV is set) is all zeros, the MAC does not check the 15th and 16th bytes for VLAN tag comparison and declares all packets with Type field value of 0x8100 or 0x88a8 as VLAN packets.

VLAN Hash table register (ETH_MACVHTR)

Address offset: 0x0058

Reset value: 0x0000 0000

When the VTHM bit of *VLAN tag register (ETH_MACVTR)* register is set, the 16-bit VLAN Hash Table register is used for group address filtering based on the VLAN tag. For Hash filtering, the content of the 16-bit VLAN tag or 12-bit VLAN ID (based on the ETV bit of *VLAN tag register (ETH_MACVTR)* register) in the incoming packet is passed through the CRC logic. The upper four bits of the calculated CRC are used to index the contents of the VLAN Hash table. For example, a Hash value of 1000 selects Bit 8 of the VLAN Hash table.

The Hash value of the destination address is calculated in the following way:

1. Calculate the 32-bit CRC for the VLAN tag or ID (For steps to calculate CRC32, see Section 3.2.8 of IEEE 802.3).
2. Perform bitwise reversal for the value obtained in step 1.
3. Take the upper four bits from the value obtained in step 2.

| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:21 Reserved, must be kept at reset value.

Bit 20 **VLTi**: VLAN Tag Input

When this bit is set, it indicates that the VLAN tag to be inserted or replaced in Tx packet should be taken from the Tx descriptor.

Bit 19 **CSVL**: C-VLAN or S-VLAN

When this bit is set, S-VLAN type (0x88a8) is inserted or replaced in the 13th and 14th bytes of transmitted packets. When this bit is reset, C-VLAN type (0x8100) is inserted or replaced in the 13th and 14th bytes of transmitted packets.

- 0: C-LAN
- 1: S-LAN

Bit 18 **VLP**: VLAN Priority Control

When this bit is set, the control bits[17:16] are used for VLAN deletion, insertion, or replacement. When this bit is reset, bits[17:16] are ignored.

Bits 17:16 **VLC[1:0]**: VLAN Tag Control in Transmit Packets

- 00: No VLAN tag deletion, insertion, or replacement
- 01: VLAN tag deletion. The MAC removes the VLAN type (bytes 13 and 14) and VLAN tag (bytes 15 and 16) of all transmitted packets with VLAN tags.
- 10: VLAN tag insertion. The MAC inserts VLT in bytes 15 and 16 of the packet after inserting the Type value (0x8100 or 0x88a8) in bytes 13 and 14. This operation is performed on all transmitted packets, irrespective of whether they already have a VLAN tag.
- 11: VLAN tag replacement. The MAC replaces VLT in bytes 15 and 16 of all VLAN-type transmitted packets (Bytes 13 and 14 are 0x8100 or 0x88a8).

Note: Changes to this field take effect only on the start of a packet. If you write this register field when a packet is being transmitted, only the subsequent packet can use the updated value, that is, the current packet does not use the updated value.

Bits 15:0 **VLT[15:0]**: VLAN Tag for Transmit Packets

This field contains the value of the VLAN tag to be inserted or replaced. The value must only be changed when the transmit lines are inactive or during the initialization phase.

The following list describes the bits of this field:

- Bits[15:13]: User Priority
- Bit 12: Canonical Format Indicator (CFI) or Drop Eligible Indicator (DEI)
- Bits[11:0]: VLAN Identifier (VID) field of VLAN tag

Inner VLAN inclusion register (ETH_MACIVIR)

Address offset: 0x0064

Reset value: 0x0000 0000

The Inner VLAN Tag Inclusion or Replacement register contains the inner VLAN tag to be inserted or replaced in the Transmit packet. It also contains the inner VLAN tag insertion controls.

Bits 31:21 Reserved, must be kept at reset value.

Bit 20 **VLTi**: VLAN Tag Input

When this bit is set, it indicates that the VLAN tag to be inserted or replaced in Tx packet should be taken from the Tx descriptor

Bit 19 **CSVL**: C-VLAN or S-VLAN

When this bit is set, S-VLAN type (0x88A8) is inserted or replaced in the 13th and 14th bytes of transmitted packets. When this bit is reset, C-VLAN type (0x8100) is inserted or replaced in the 13th and 14th bytes of transmitted packets.

- 0: C-LAN
- 1: S-LAN

Bit 18 **VLP**: VLAN Priority Control

When this bit is set, the VLC field is used for VLAN deletion, insertion, or replacement. When this bit is reset, the VLC field is ignored.

Bits 17:16 **VLC[1:0]**: VLAN Tag Control in Transmit Packets

- 00: No VLAN tag deletion, insertion, or replacement
- 01: VLAN tag deletion

The MAC removes the VLAN type (bytes 17 and 18) and VLAN tag (bytes 19 and 20) of all transmitted packets with VLAN tags.

10: VLAN tag insertion

The MAC inserts VLT in bytes 19 and 20 of the packet after inserting the Type value (0x8100 or 0x88a8) in bytes 17 and 18. This operation is performed on all transmitted packets, irrespective of whether they already have a VLAN tag.

11: VLAN tag replacement

The MAC replaces VLT in bytes 19 and 20 of all VLAN-type transmitted packets (Bytes 17 and 18 are 0x8100 or 0x88a8).

Note: Changes to this field take effect only on the start of a packet. If you write to this register field when a packet is being transmitted, only the subsequent packet can use the updated value, that is, the current packet does not use the updated value.

Bits 15:0 **VLT[15:0]**: VLAN Tag for Transmit Packets

This field contains the value of the VLAN tag to be inserted or replaced. The value must only be changed when the transmit lines are inactive or during the initialization phase.

The following list describes the bits of this field:

Bits[15:13]: User Priority

Bit 12: Canonical Format Indicator (CFI) or Drop Eligible Indicator (DEI)

Bits[11:0]: VLAN Identifier (VID) field of VLAN tag

Tx Queue flow control register (ETH_MACQTXFCR)

Address offset: 0x0070

Reset value: 0x0000 0000

The Flow Control register controls the generation and reception of the Control (Pause Command) packets by the Flow control module of the MAC. A Write to a register with the Busy bit set to 1 triggers the Flow Control block to generate a Pause packet. The fields of the control packet are selected as specified in the 802.3x specification, and the Pause Time value from this register is used in the Pause Time field of the control packet. The Busy bit remains set until the control packet is transferred onto the cable. The application must make sure that the Busy bit is cleared before writing to the register.

| | | | | | | | | | | | | | | | | |
|----------|-----|-----|-----|-----|-----|-----|-----|------|----------|----|----|----|-----|-----|-----|---------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | |

| | | | | | | | | rw | rw | rw | rw | | | rw | rw | |

Bits 31:16 **PT[15:0]**: Pause Time

This field holds the value to be used in the Pause Time field in the Tx control packet. I

Bits 15:8 Reserved, must be kept at reset value.

Bit 7 **DZPQ**: Disable Zero-Quanta Pause

When this bit is set, it disables the automatic generation of the zero-quanta Pause packets.

When this bit is reset, normal operation with automatic zero-quanta Pause packet generation is enabled.

Bits 6:4 **PLT[2:0]**: Pause Low Threshold

This field configures the threshold of the Pause timer at which the input flow is checked for automatic retransmission of the Pause packet.

The threshold values should be always less than the Pause Time configured in Bits[31:16]. For example, if PT = 100H (256 slot times), and PLT = 001, a second Pause packet is automatically transmitted at 228 (256-28) slot times after the first Pause packet is transmitted.

The following list provides the threshold values for different values:

000: Pause Time minus 4 Slot Times (PT -4 slot times)

001: Pause Time minus 28 Slot Times (PT -28 slot times)

010: Pause Time minus 36 Slot Times (PT -36 slot times)

011: Pause Time minus 144 Slot Times (PT -144 slot times)

100: Pause Time minus 256 Slot Times (PT -256 slot times)

101: Pause Time minus 512 Slot Times (PT -512 slot times)

110 to 111: Reserved, must not be used

The slot time is defined as the time taken to transmit 512 bits (64 bytes) on the MII interface.

This (approximate) computation is based on the packet size (64, 1518, 2000, 9018, 16384, or 32768) + 2 Pause Packet Size + IPG in Slot Times.

Bits 3:2 Reserved, must be kept at reset value.

Bit 1 **TFE**: Transmit Flow Control Enable

Full-duplex mode: when this bit is set, the MAC enables the flow control operation to Tx Pause packets. When this bit is reset, the flow control operation in the MAC is disabled, and the MAC does not transmit any Pause packets.

Half-duplex mode: when this bit is set, the MAC enables the backpressure operation. When this bit is reset, the backpressure feature is disabled.

Bit 0 **FCB_BPA**: Flow Control Busy or Backpressure Activate

This bit initiates a Pause packet in the Full-duplex mode and activates the backpressure function in the Half-duplex mode if the TFE bit is set.

Full-Duplex mode: this bit should be read as 0 before writing to this register. To initiate a Pause packet, the application must set this bit to 1. During Control packet transfer, this bit continues to be set to indicate that a packet transmission is in progress. When Pause packet transmission is complete, the MAC resets this bit to 0. You should not write to this register until this bit is cleared.

Half-duplex mode: When this bit is set (and TFE bit is set) in the Half-duplex mode, the MAC asserts the backpressure. During backpressure, when the MAC receives a new packet, the transmitter starts sending a JAM pattern resulting in a collision. When the MAC is configured for the Full-duplex mode, the BPA is automatically disabled.

Rx flow control register (ETH_MACRXFCR)

Address offset: 0x0090

Reset value: 0x0000 0000

The Receive Flow Control register controls the pausing of MAC Transmit based on the received Pause packet.

| | | | | | | | | | | | | | | rw | rw |

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 UP: Unicast Pause Packet Detect

A pause packet is processed when it has the unique multicast address specified in the IEEE 802.3. When this bit is set, the MAC can also detect Pause packets with unicast address of the station. This unicast address should be as specified in [MAC Address 0 high register \(ETH_MACA0HR\)](#) and MAC Address 0 low register [MAC Address x low register \(ETH_MACAxLR\)](#).

When this bit is reset, the MAC only detects Pause packets with unique multicast address.

Note: The MAC does not process a Pause packet if the multicast address is different from the unique multicast address. This is also applicable to the received PFC packet when the Priority Flow Control (PFC) is enabled. The unique multicast address (0x01_80_C2_00_00_01) is as specified in IEEE 802.1 Qbb-2011.

Bit 0 RFE: Receive Flow Control Enable

When this bit is set and the MAC is operating in Full-duplex mode, the MAC decodes the received Pause packet and disables its transmitter for a specified (Pause) time. When this bit is reset or the MAC is operating in Half-duplex mode, the decode function of the Pause packet is disabled.

When PFC is enabled, flow control is enabled for PFC packets. The MAC decodes the received PFC packet and disables the Transmit queue, with matching priorities, for a duration of received Pause time.

Interrupt status register (ETH_MACISR)

Address offset: 0x00B0

Reset value: 0x0000 0000

The Interrupt Status register contains the status of interrupts.

| | rc_r | rc_r | rc_r | | r | r | r | | | r | r | r | | | |

Bits 31:15 Reserved, must be kept at reset value.

Bit 14 **RXSTIS**: Receive Status Interrupt

This bit indicates the status of received packets. This bit is set when the RWT bit is set in the *Rx Tx status register (ETH_MACRXTXSR)*. This bit is cleared when the corresponding interrupt source bit is read (or corresponding interrupt source bit is written to 1 when RCWE bit of *CSR software control register (ETH_MACCSRSWCR)* is set) in the ETH_MACISR register.

Bit 13 **TXSTIS**: Transmit Status Interrupt

This bit indicates the status of transmitted packets. This bit is set when any of the following bits is set in the *Rx Tx status register (ETH_MACRXTXSR)*:

- Excessive Collision (EXCOL)
- Late Collision (LCOL)
- Excessive Deferral (EXDEF)
- Loss of Carrier (LCARR)
- No Carrier (NCARR)
- Jabber Timeout (TJT)

This bit is cleared when the corresponding interrupt source bit is read (or corresponding interrupt source bit is written to 1 when RCWE bit of *CSR software control register (ETH_MACCSRSWCR)* is set) in the ETH_MACISR register.

Bit 12 **TSIS**: Timestamp Interrupt Status

If the Timestamp feature is enabled, this bit is set when any of the following conditions is true:

- The system time value is equal to or exceeds the value specified in the Target Time High and Low registers.
- There is an overflow in the Seconds register.
- The Target Time Error occurred, that is, programmed target time already elapsed.

If the Auxiliary Snapshot feature is enabled, this bit is set when the auxiliary snapshot trigger is asserted.

When drop transmit status is enabled in MTL, this bit is set when the captured transmit timestamp is updated in the *Tx timestamp status nanoseconds register (ETH_MACTXTSSNR)* and *Tx timestamp status seconds register (ETH_MACTXTSSSR)* registers.

When PTP offload feature is enabled, this bit is set when the captured transmit timestamp is updated in the *Tx timestamp status nanoseconds register (ETH_MACTXTSSNR)* and *Tx timestamp status seconds register (ETH_MACTXTSSSR)* registers, for PTO generated Delay Request and Pdelay request packets.

This bit is cleared when the corresponding interrupt source bit is read (or corresponding interrupt source bit is written to 1 when RCWE bit of *CSR software control register (ETH_MACCSR)* is set) in the *Timestamp status register (ETH_MACTSSR)*.

Bit 11 Reserved, must be kept at reset value.

Bit 10 **MMCTXIS**: MMC Transmit Interrupt Status

This bit is set high when an interrupt is generated in the *MMC Tx interrupt register (ETH_MMC_TX_INTERRUPT)*. This bit is cleared when all bits in this interrupt register are cleared.

Bit 9 **MMCRXIS**: MMC Receive Interrupt Status

This bit is set high when an interrupt is generated in the *MMC Rx interrupt register (ETH_MMC_RX_INTERRUPT)*. This bit is cleared when all bits in this interrupt register are cleared.

Bit 8 **MMCIS**: MMC Interrupt Status

This bit is set high when MMCTXIS or MMCRXIS is set high. This bit is cleared only when all these bits are low.

Bits 7:6 Reserved, must be kept at reset value.

Bit 5 **LPIIS**: LPI Interrupt Status

This bit is set for any LPI state entry or exit in the MAC Transmitter or Receiver. This bit is cleared when the TLPIEN bit of *LPI control and status register (ETH_MACLCSR)* is read.

Bit 4 **PMTIS**: PMT Interrupt Status

This bit is set when a Magic packet or Wake-on-LAN packet is received in the power-down mode (RWKPRCVD and MGKPRCVD bits in *ETH_MACPCSR* register). This bit is cleared when Bits[6:5] are cleared because of a Read operation to the *PMT control status register (ETH_MACPCSR)*.

Bit 3 **PHYIS**: PHY Interrupt

This bit is set when rising edge is detected on the ETH_PHY_INTN input. This bit is cleared when this register is read.

Bits 2:0 Reserved, must be kept at reset value.

Interrupt enable register (ETH_MACIER)

Address offset: 0x00B4

Reset value: 0x0000 0000

The Interrupt Enable register contains the masks for generating the interrupts.

| | | | | | | | | | | | | | | | |

Bits 31:15 Reserved, must be kept at reset value.

Bit 14 **RXSTSIE**: Receive Status Interrupt Enable

When this bit is set, it enables the assertion of the interrupt signal because of the setting of RXSTSIS bit in the *Interrupt status register (ETH_MACISR)*.

Bit 13 **TXSTSIE**: Transmit Status Interrupt Enable

When this bit is set, it enables the assertion of the interrupt signal because of the setting of TXSTSIS bit in the *Interrupt status register (ETH_MACISR)*.

Bit 12 **TSIE**: Timestamp Interrupt Enable

When this bit is set, it enables the assertion of the interrupt signal because of the setting of TSIS bit in *Interrupt status register (ETH_MACISR)*.

Bits 11:6 Reserved, must be kept at reset value.

Bit 5 **LPIIE**: LPI Interrupt Enable

When this bit is set, it enables the assertion of the interrupt signal because of the setting of LPIIS bit in *Interrupt status register (ETH_MACISR)*.

Bit 4 **PMTIE**: PMT Interrupt Enable

When this bit is set, it enables the assertion of the interrupt signal because of the setting of PMTIS bit in *Interrupt status register (ETH_MACISR)*.

Bit 3 **PHYIE**: PHY Interrupt Enable

When this bit is set, it enables the assertion of the interrupt signal because of the setting of PHYIS bit in *Interrupt status register (ETH_MACISR)*.

Bits 2:0 Reserved, must be kept at reset value.

Rx Tx status register (ETH_MACRXTXSR)

Address offset: 0x00B8

Reset value: 0x0000 0000

The Receive Transmit Status register contains the Receive and Transmit Error status.

| | | | | | | | | | | | | | | | |

| | | | | | | | rc_r | | | rc_r | rc_r | rc_r | rc_r | rc_r | rc_r |

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 RWT: Receive Watchdog Timeout

This bit is set when a packet with length greater than 2,048 bytes is received (10, 240 bytes when Jumbo Packet mode is enabled) and the WD bit is reset in the *Operating mode configuration register (ETH_MACCCR)*. This bit is set when a packet with length greater than 16,383 bytes is received and the WD bit is set in the *Operating mode configuration register (ETH_MACCCR)*.

Cleared on read (or write of 1 when RCWE bit in *CSR software control register (ETH_MACCSRWCR)* is set).

Bits 7:6 Reserved, must be kept at reset value.

Bit 5 EXCOL: Excessive Collisions

When the DTXSTS bit is set in the *Operating mode Register (ETH_MTLOMR)*, this bit indicates that the transmission aborted after 16 successive collisions while attempting to transmit the current packet. If the DR bit is set in the *Operating mode configuration register (ETH_MACCCR)*, this bit is set after the first collision and the packet transmission is aborted. Cleared on read (or write of 1 when RCWE bit in *CSR software control register (ETH_MACCSRWCR)* is set).

Bit 4 LCOL: Late Collision

When the DTXSTS bit is set in the *Operating mode Register (ETH_MTLOMR)*, this bit indicates that the packet transmission aborted because a collision occurred after the collision window (64 bytes including Preamble in MII mode).

This bit is not valid if the Underflow error occurs.

Cleared on read (or write of 1 when RCWE bit in *CSR software control register (ETH_MACCSRWCR)* is set).

Bit 3 EXDEF: Excessive Deferral

When the DTXSTS bit is set in the *Operating mode Register (ETH_MTLOMR)* and the DC bit is set in the *Operating mode configuration register (ETH_MACCCR)*, this bit indicates that the transmission ended because of excessive deferral of over 24,288 bit times (155,680 when Jumbo packet is enabled).

Cleared on read (or write of 1 when RCWE bit in *CSR software control register (ETH_MACCSRWCR)* is set).

Bit 2 **LCARR**: Loss of Carrier

When the DTXSTS bit is set in the *Operating mode Register (ETH_MTL0MR)*, this bit indicates that the loss of carrier occurred during packet transmission, that is, the ETH_CRS signal was inactive for one or more transmission clock periods during packet transmission. This bit is valid only for packets transmitted without collision.

Cleared on read (or write of 1 when RCWE bit in *CSR software control register (ETH_MACCSRWCR)* is set).

Bit 1 **NCARR**: No Carrier

When the DTXSTS bit is set in the *Operating mode Register (ETH_MTL0MR)*, this bit indicates that the carrier signal from the PHY is not present at the end of preamble transmission.

Cleared on read (or write of 1 when RCWE bit in *CSR software control register (ETH_MACCSRWCR)* is set).

Bit 0 **TJT**: Transmit Jabber Timeout

This bit indicates that the Transmit Jabber Timer expired which happens when the packet size exceeds 2,048 bytes (10,240 bytes when the Jumbo packet is enabled) and JD bit is reset in the *Operating mode configuration register (ETH_MACCR)*. This bit is set when the packet size exceeds 16,383 bytes and the JD bit is set in the *Operating mode configuration register (ETH_MACCR)*.

Cleared on read (or write of 1 when RCWE bit in *CSR software control register (ETH_MACCSRWCR)* is set).

PMT control status register (ETH_MACPCSR)

Address offset: 0x00C0

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------------|------|------|-------------|------|---------|-----------|------|------|----------|----------|------|------|----------|----------|--------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | rw | rw | | | r | rc_r | | | rw | rw | rw |

Bit 31 **RWKFILTRST**: Remote wake-up Packet Filter Register Pointer Reset

When this bit is set, the remote wake-up packet filter register pointer is reset to 0. It is automatically cleared after 1 clock cycle.

Bits 30:29 Reserved, must be kept at reset value.

Bits 28:24 **RWKPTR[4:0]**: Remote wake-up FIFO Pointer

This field gives the current value (0 to 7) of the Remote wake-up Packet Filter register pointer. When the value of this pointer is equal to 7, the contents of the Remote wake-up Packet Filter Register are transferred to the eth_mii_rx_clk domain when a Write occurs to that register.

Bits 23:11 Reserved, must be kept at reset value.

Bit 10 RWKPFPE: Remote wake-up Packet Forwarding Enable

When this bit is set along with RWKPKTEN, the MAC receiver drops all received frames until it receives the expected wake-up frame. All frames after that event including the received wake-up frame are forwarded to application. This bit is then self-cleared on receiving the wake-up packet.

The application can also clear this bit before the expected wake-up frame is received. In such cases, the MAC reverts to the default behavior where packets received are forwarded to the application. This bit must only be set when RWKPKTEN is set high and PWRDWN is set low. The setting of this bit has no effect when PWRDWN is set high.

Note: If Magic Packet Enable and wake-up Frame Enable are both set along with setting of this bit and Magic Packet is received prior to wake-up frame, this bit is self-cleared on receiving Magic Packet, the received Magic packet is dropped, and all frames after received Magic Packet are forwarded to application.

Bit 9 GLBLUCAST: Global Unicast

When this bit set, any unicast packet filtered by the MAC (DAF) address recognition is detected as a remote wake-up packet.

Bits 8:7 Reserved, must be kept at reset value.

Bit 6 RWKPRCVD: Remote wake-up Packet Received

When this bit is set, it indicates that the power management event is generated because of the reception of a remote wake-up packet. This bit is cleared when this register is read.

Bit 5 MGKPRCVD: Magic Packet Received

When this bit is set, it indicates that the power management event is generated because of the reception of a magic packet. This bit is cleared when this register is read (or written to 1 when RCWE bit in *CSR software control register (ETH_MACCSRSWGR)* is set).

Bits 4:3 Reserved, must be kept at reset value.

Bit 2 RWKPKTEN: Remote wake-up Packet Enable

When this bit is set, a power management event is generated when the MAC receives a remote wake-up packet.

Bit 1 MGKPKTEN: Magic Packet Enable

When this bit is set, a power management event is generated when the MAC receives a magic packet.

Bit 0 PWRDWN: Power Down

When this bit is set, the MAC receiver drops all received packets until it receives the expected magic packet or remote wake-up packet. This bit is then self-cleared and the power-down mode is disabled. The software can clear this bit before the expected magic packet or remote wake-up packet is received. The packets received by the MAC after this bit is cleared are forwarded to the application. This bit must only be set when the Magic Packet Enable, Global Unicast, or Remote wake-up Packet Enable bit is set high.

Note: You can gate-off the CSR clock during the power-down mode. However, when the CSR clock is gated-off, you cannot perform any read or write operations on this register. Therefore, the Software cannot clear this bit.

Remote wake-up packet filter register (ETH_MACRWKPFRR)

Address offset: 0x00C4

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|-------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bits 31:0 **MACRWKPFRR[31:0]**: Remote wake-up packet filter

Refer to [Table 554](#), [Table 555](#) and [Table 556](#) for details on register content and programming sequence.

The ETH_MACRWKPFRR register at address 0x00C4 loads the wake-up Packet Filter register.

To load values in a wake-up Packet Filter register, the entire register (ETH_MACRWKPFRR) must be written. The ETH_MACRWKPFRR register is loaded by sequentially loading the eight, sixteen or thirty two register values in address (0x00C4) for ETH_MACRWKPFRR value 0 to 7, respectively. The ETH_MACRWKPFRR register is read in a similar way. The Ethernet peripheral updates the ETH_MACRWKPFRR register current pointer value in Bits[26:24] of ETH_MACPCSR register.

LPI control and status register (ETH_MACLCSR)

Address offset: 0x00D0

Reset value: 0x0000 0000

The LPI Control and Status Register controls the LPI functions and provides the LPI interrupt status. The status bits are cleared when this register is read.

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|--------|--------|------|------|---------|-------|--------|--------|--------|--------|

| | | | | | | | | | | rW | rW | rW | | rW | rW |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | RLPIST | TLPIST | Res. | Res. | Res. | Res. | RLPIEX | RLPIEN | TLPIEX | TLPIEN |
| | | | | | | r | r | | | | | r | r | r | r |

Bits 31:22 Reserved, must be kept at reset value.

Bit 21 **LPITCSE**: LPI Tx Clock Stop Enable

When this bit is set, the MAC asserts `sbd_tx_clk_gating_ctrl_o` signal high after it enters Tx LPI mode to indicate that the Tx clock to MAC can be stopped. When this bit is reset, the MAC does not assert `sbd_tx_clk_gating_ctrl_o` signal high after it enters Tx LPI mode. If RGMII Interface is selected, the Tx clock is required for transmitting the LPI pattern. The Tx Clock cannot be gated and so the LPITCSE bit cannot be programmed.

Bit 20 **LPITE**: LPI Timer Enable

This bit controls the automatic entry of the MAC Transmitter into and exit out of the LPI state. When LPITE, LPITXA and LPIEN bits are set, the MAC Transmitter enters LPI state only when the complete MAC TX data path is IDLE for a period indicated by the `ETH_MACLETR` register.

After entering LPI state, if the data path becomes non-IDLE (due to a new packet being accepted for transmission), the Transmitter exits LPI state but does not clear LPIEN bit. This enables the re-entry into LPI state when it is IDLE again.

When LPITE is 0, the LPI Auto timer is disabled and MAC Transmitter enters LPI state based on the settings of LPITXA and LPIEN bit descriptions.

Bit 19 **LPITXA**: LPI Tx Automate

This bit controls the behavior of the MAC when it is entering or coming out of the LPI mode on the Transmit side.

If the LPITXA and LPIEN bits are set to 1, the MAC enters the LPI mode only after all outstanding packets (in the core) and pending packets (in the application interface) have been transmitted. The MAC comes out of the LPI mode when the application sends any packet for transmission or the application issues a Tx FIFO Flush command. In addition, the MAC automatically clears the LPIEN bit when it exits the LPI state. If Tx FIFO Flush is set in the FTQ bit of `ETH_MTLTxQOMR`, when the MAC is in the LPI mode, it exits the LPI mode. When this bit is 0, the LPIEN bit directly controls behavior of the MAC when it is entering or coming out of the LPI mode.

Bit 18 Reserved, must be kept at reset value.

Bit 17 **PLS**: PHY Link Status

This bit indicates the link status of the PHY. The MAC Transmitter asserts the LPI pattern only when the link status is up (OKAY) at least for the time indicated by the LPI LS TIMER.

When this bit is set, the link is considered to be okay (UP) and when this bit is reset, the link is considered to be down.

Bit 16 **LPIEN**: LPI Enable

When this bit is set, it instructs the MAC Transmitter to enter the LPI state. When this bit is reset, it instructs the MAC to exit the LPI state and resume normal transmission.

This bit is cleared when the LPITXA bit is set and the MAC exits the LPI state because of the arrival of a new packet for transmission.

Bits 15:10 Reserved, must be kept at reset value.

Bit 9 **RLPIST**: Receive LPI State

When this bit is set, it indicates that the MAC is receiving the LPI pattern on the MII interface.

Bit 8 **TLPIST**: Transmit LPI State

When this bit is set, it indicates that the MAC is transmitting the LPI pattern on the MII interface.

Bits 7:4 Reserved, must be kept at reset value.

Bit 3 **RLPIEX**: Receive LPI Exit

When this bit is set, it indicates that the MAC Receiver has stopped receiving the LPI pattern on the MII interface, exited the LPI state, and resumed the normal reception. This bit is cleared by a read into this register (or by writing it to 1 when RCWE bit in *CSR software control register (ETH_MACCSRSWCR)* is set).

Note: This bit may not be set if the MAC stops receiving the LPI pattern for a very short duration, such as, less than three clock cycles of CSR clock.

Bit 2 **RLPIEN**: Receive LPI Entry

When this bit is set, it indicates that the MAC Receiver has received an LPI pattern and entered the LPI state. This bit is cleared by a read into this register (or by writing it to 1 when RCWE bit in *CSR software control register (ETH_MACCSRSWCR)* is set).

Note: This bit may not be set if the MAC stops receiving the LPI pattern for a very short duration, such as, less than three clock cycles of CSR clock.

Bit 1 **TLPIEX**: Transmit LPI Exit

When this bit is set, it indicates that the MAC transmitter exited the LPI state after the application cleared the LPIEN bit and the LPI TW Timer has expired. This bit is cleared by a read into this register (or by writing it to 1 when RCWE bit in *CSR software control register (ETH_MACCSRSWCR)* is set).

Bit 0 **TLPIEN**: Transmit LPI Entry

When this bit is set, it indicates that the MAC Transmitter has entered the LPI state because of the setting of the LPIEN bit. This bit is cleared by a read into this register (or by writing it to 1 when RCWE bit in *CSR software control register (ETH_MACCSRSWCR)* is set).

LPI timers control register (ETH_MACLTCR)

Address offset: 0x00D4

Reset value: 0x03E8 0000

The LPI Timers Control register controls the timeout values in the LPI states. It specifies the time for which the MAC transmits the LPI pattern and also the time for which the MAC waits before resuming the normal transmission.

| | | | | | | | | | | | | | | | |

| TWT[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:26 Reserved, must be kept at reset value.

Bits 25:16 **LST[9:0]**: LPI LS Timer

This field specifies the minimum time (in milliseconds) for which the link status from the PHY should be up (OKAY) before the LPI pattern can be transmitted to the PHY. The MAC does not transmit the LPI pattern even when the LPIEN bit is set unless the LPI LS Timer reaches the programmed terminal count. The default value of the LPI LS Timer is 1000 (1 sec) as defined in the IEEE standard.

Bits 15:0 **TWT[15:0]**: LPI TW Timer

This field specifies the minimum time (in microseconds) for which the MAC waits after it stops transmitting the LPI pattern to the PHY and before it resumes the normal transmission. The TLPIEX status bit is set after the expiry of this timer.

LPI entry timer register (ETH_MACLETR)

Address offset: 0x00D8

Reset value: 0x0000 0000

This register controls the Tx LPI entry timer. This counter is enabled only when LPITE bit of [LPI control and status register \(ETH_MACLCSR\)](#) register is set to 1.

| | | | | | | | | | | | | | | | |

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:0 **LPIET[19:0]**: LPI Entry Timer

This field specifies the time in microseconds the MAC waits to enter LPI mode, after it has transmitted all the frames. This field is valid and used only when LPITE and LPITXA are set to 1.

Bits [2:0] are read-only so that the granularity of this timer is in steps of 8 micro-seconds.

One-microsecond-tick counter register (ETH_MAC1USTCR)

Address offset: 0x00DC

Reset value: 0x0000 0000

This register controls the generation of the Reference time (one-microsecond tick) for all the LPI timers. This timer has to be programmed by the software initially.

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:0 TIC_1US_CNTR[11:0]: 1 µs tick Counter

The application must program this counter so that the number of clock cycles of CSR clock is 1 µs (subtract 1 from the value before programming).

For example if the CSR clock is 100 MHz then this field needs to be programmed to 100 - 1 = 99 (which is 0x63).

This is required to generate the 1 µs events that are used to update some of the EEE related counters.

Version register (ETH_MACVR)

Address offset: 0x0110

Reset value: 0x0000 3142

The version register identifies the version of the Ethernet peripheral.

| | | | | | | | | | | | | | | | |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:8 **USERVER[7:0]**: ST-defined version

Bits 7:0 **SNPSVER[7:0]**: IP version

Debug register (ETH_MACDR)

Address offset: 0x0114

Reset value: 0x0000 0000

The Debug register provides the debug status of various MAC blocks.

| | | | | | | | | | | | | | | | |

| | | | | | | | | | | | | | r | r | r |

Bits 31:19 Reserved, must be kept at reset value.

Bits 18:17 **TFCSTS[1:0]**: MAC Transmit Packet Controller Status

This field indicates the state of the MAC Transmit Packet Controller module:

00: Idle state

01: Waiting for one of the following:

- Status of the previous packet
- IPG or backoff period to be over

10: Generating and transmitting a Pause control packet (in Full-duplex mode)

11: Transferring input packet for transmission

Bit 16 **TPESTS**: MAC MII Transmit Protocol Engine Status

When this bit is set, it indicates that the MAC MII transmit protocol engine is actively transmitting data, and it is not in the Idle state.

Bits 15:3 Reserved, must be kept at reset value.

Bits 2:1 **RFCFCSTS[1:0]**: MAC Receive Packet Controller FIFO Status

When this bit is set, this field indicates the active state of the small FIFO Read and Write controllers of the MAC Receive Packet Controller module.

Bit 0 **RPESTS**: MAC MII Receive Protocol Engine Status

When this bit is set, it indicates that the MAC MII receive protocol engine is actively receiving data, and it is not in the Idle state.

HW feature 0 register (ETH_MACHWF0R)

Address offset: 0x011C

Reset value: 0x0A0D 73F7

This register indicates the presence of first set of the optional features or functions of the Ethernet peripheral. The software driver can use this register to dynamically enable or disable the programs related to the optional blocks.

- Bit 31 Reserved, must be kept at reset value.
- Bits 30:28 **ACTPHYSEL[2:0]**: Active PHY Selected
When you have multiple PHY interfaces in your configuration, this field indicates the sampled value of `phy_intf_sel_i` during reset de-assertion:
000: GMII or MII
001: RGMII
010: SGMII
011: TBI
100: RMII
101: RTBI
110: SMII
Others: Reserved, must not be used
- Bit 27 **SAVLANINS**: Source Address or VLAN Insertion Enable
This bit is set to 1 when the Enable SA and VLAN Insertion on Tx option is selected
- Bits 26:25 **TSSTSEL[1:0]**: Timestamp System Time Source
This bit indicates the source of the Timestamp system time:
01: Internal
10: External
11: Both
00: Reserved, must not be used
This bit is set to 1 when the Enable IEEE 1588 Timestamp Support option is selected
- Bit 24 **MACADR64SEL**: MAC Addresses 64-127 Selected
This bit is set to 1 when the Enable Additional 64 MAC Address Registers (64-127) option is selected
- Bit 23 **MACADR32SEL**: MAC Addresses 32-63 Selected
This bit is set to 1 when the Enable Additional 32 MAC Address Registers (32-63) option is selected
- Bits 22:18 **ADDMACADRSEL[4:0]**: MAC Addresses 1-31 Selected
This bit is set to 1 when the Enable Additional 1-31 MAC Address Registers option is selected
- Bit 17 Reserved, must be kept at reset value.
- Bit 16 **RXCOESEL**: Receive Checksum Offload Enabled
This bit is set to 1 when the Enable Receive TCP/IP Checksum Check option is selected
- Bit 15 Reserved, must be kept at reset value.
- Bit 14 **TXCOESEL**: Transmit Checksum Offload Enabled
This bit is set to 1 when the Enable Transmit TCP/IP Checksum Insertion option is selected
- Bit 13 **EEESEL**: Energy Efficient Ethernet Enabled
This bit is set to 1 when the Enable Energy Efficient Ethernet (EEE) option is selected
- Bit 12 **TSEL**: IEEE 1588-2008 Timestamp Enabled
This bit is set to 1 when the Enable IEEE 1588 Timestamp Support option is selected
- Bits 11:10 Reserved, must be kept at reset value.
- Bit 9 **ARPOFFSEL**: ARP Offload Enabled
This bit is set to 1 when the Enable IPv4 ARP Offload option is selected
- Bit 8 **MMCSEL**: RMON Module Enable
This bit is set to 1 when the Enable MAC management counters (MMC) option is selected

- Bit 7 **MGKSEL**: PMT Magic Packet Enable
This bit is set to 1 when the Enable Magic Packet Detection option is selected
- Bit 6 **RWKSEL**: PMT Remote wake-up Packet Enable
This bit is set to 1 when the Enable Remote wake-up Packet Detection option is selected
- Bit 5 **SMASEL**: SMA (MDIO) Interface
This bit is set to 1 when the Enable Station Management (MDIO Interface) option is selected
- Bit 4 **VLHASH**: VLAN Hash Filter Selected
This bit is set to 1 when the Enable VLAN Hash Table Based Filtering option is selected
- Bit 3 **PCSSEL**: PCS Registers (TBI, SGMII, or RTBI PHY interface)
This bit is set to 1 when the TBI, SGMII, or RTBI PHY interface option is selected
- Bit 2 **HDSEL**: Half-duplex Support
This bit is set to 1 when the Half-duplex mode is selected
- Bit 1 **GMISEL**: 1000 Mbps Support
This bit is set to 1 when 1000 Mbps is selected as operating mode.
- Bit 0 **MIISEL**: 10 or 100 Mbps Support
This bit is set to 1 when 10/100 Mbps is selected as operating mode.

HW feature 1 register (ETH_MACHWF1R)

Address offset: 0x0120

Reset value: 0x1104 1904

This register indicates the presence of second set of the optional features or functions of the Ethernet peripheral. The software driver can use this register to dynamically enable or disable the programs related to the optional blocks.

- Bit 31 Reserved, must be kept at reset value.
- Bits 30:27 **L3L4FNUM[3:0]**: Total number of L3 or L4 Filters
This field indicates the total number of L3 or L4 filters:
0000: No L3 or L4 Filter
0001: 1 L3 or L4 Filter
0010: 2 L3 or L4 Filters
..
1000: 8 L3 or L4
- Bit 26 Reserved, must be kept at reset value.
- Bits 25:24 **HASHTBLSZ[1:0]**: Hash Table Size
This field indicates the size of the Hash table:
00: No Hash table
01: 64
10: 128
11: 256
- Bit 23 **POUOST**: One Step for PTP over UDP/IP Feature Enable
This bit is set to 1 when the Enable one step timestamp for PTP over UDP/IP feature is selected.
- Bit 22 Reserved, must be kept at reset value.
- Bit 21 **RAVSEL**: Rx Side Only AV Feature Enable
This bit is set to 1 when the Enable Audio video bridging option on Rx Side Only is selected.
- Bit 20 **AVSEL**: AV Feature Enable
This bit is set to 1 when the Enable Audio video bridging option is selected.
- Bit 19 **DBGMEMA**: DMA Debug Registers Enable
This bit is set to 1 when the Debug Mode Enable option is selected
- Bit 18 **TSOEN**: TCP Segmentation Offload Enable
This bit is set to 1 when the Enable TCP Segmentation Offloading for TCP/IP Packets option is selected
- Bit 17 **SPHEN**: Split Header Feature Enable
This bit is set to 1 when the Enable Split Header Structure option is selected
- Bit 16 **DCBEN**: DCB Feature Enable
This bit is set to 1 when the Enable Data Center Bridging option is selected
- Bits 15:14 **ADDR64[1:0]**: Address width
This field indicates the configured address width.
00: 32 bits
Others: Reserved, must not be used
- Bit 13 **ADVTHWORD**: IEEE 1588 High Word Register Enable
This bit is set to 1 when the Add IEEE 1588 Higher Word Register option is selected
- Bit 12 **PTOEN**: PTP Offload Enable
This bit is set to 1 when the Enable PTP Timestamp Offload Feature is selected.
- Bit 11 **OSTEN**: One-Step Timestamping Enable
This bit is set to 1 when the Enable One-Step Timestamp Feature is selected.

Bits 10:6 **TXFIFOSIZE[4:0]**: MTL Transmit FIFO Size

This field contains the configured value of MTL Tx FIFO in bytes expressed as Log to base 2 minus 7, that is, $\text{Log}_2(\text{TXFIFO_SIZE}) - 7$:

00000: 128 bytes
00001: 256 bytes
00010: 512 bytes
00011: 1,024 bytes
00100: 2,048 bytes
00101: 4,096 bytes
00110: 8,192 bytes
00111: 16,384 bytes
01000: 32 Kbytes
01001: 64 Kbytes
01010: 128 Kbytes
01011 to 11111: Reserved, must not be used

Bit 5 Reserved, must be kept at reset value.

Bits 4:0 **RXFIFOSIZE[4:0]**: MTL Receive FIFO Size

This field contains the configured value of MTL Rx FIFO in bytes expressed as Log to base 2 minus 7, that is, $\text{Log}_2(\text{RXFIFO_SIZE}) - 7$:

00000: 128 bytes
00001: 256 bytes
00010: 512 bytes
00011: 1,024 bytes
00100: 2,048 bytes
00101: 4,096 bytes
00110: 8,192 bytes
00111: 16,384 bytes
01000: 32 Kbytes
01001: 64 Kbytes
01010: 128 Kbytes
01011: 256 Kbytes
01100 to 11111: Reserved, must not be used

HW feature 2 register (ETH_MACHWF2R)

Address offset: 0x0124

Reset value: 0x4100 0000

This register indicates the presence of third set of the optional features or functions of the Ethernet peripheral. The software driver can use this register to dynamically enable or disable the programs related to the optional blocks.

| | | | | | | | | | | | | | | | |
|--------------|-----------------|----|----|------|----------------|-------------|----|------------|----|--------------|------|-------------|----|------------|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| r | r | r | r | | | r | r | r | r | | | r | r | r | r |

Bit 31 Reserved, must be kept at reset value.

Bits 30:28 **AUXSNAPNUM[2:0]**: Number of Auxiliary Snapshot Inputs
 This field indicates the number of auxiliary snapshot inputs:
 000: No auxiliary input
 001: 1 auxiliary input
 010: 2 auxiliary inputs
 011: 3 auxiliary inputs
 100: 4 auxiliary inputs
 101 to 111: Reserved, must not be used

Bit 27 Reserved, must be kept at reset value.

Bits 26:24 **PPSOUTNUM[2:0]**: Number of PPS Outputs
 This field indicates the number of PPS outputs:
 000: No PPS output
 001: 1 PPS output
 010: 2 PPS outputs
 011: 3 PPS outputs
 100: 4 PPS outputs
 101 to 111: Reserved, must not be used

Bits 23:22 **TDCSZ[1:0]**: Tx DMA Descriptor Cache Size in terms of 16-byte descriptors
 00: Cache not configured
 01: Four 16-byte descriptors
 10: Eight 16-byte descriptors
 11: Sixteen 16-byte descriptors

Bits 21:18 **TXCHCNT[3:0]**: Number of DMA Transmit Channels
 This field indicates the number of DMA Transmit channels:
 0000: 1 DMA Tx Channel
 0001: 2 DMA Tx Channels
 ..
 0111: 8 DMA Tx

Bits 17:16 **RDCSZ[1:0]**: Rx DMA Descriptor Cache Size in terms of 16-byte descriptors

- 00: Cache not configured
- 01: Four 16-byte descriptors
- 10: Eight 16-byte descriptors
- 11: Sixteen 16-byte descriptors

Bits 15:12 **RXCHCNT[3:0]**: Number of DMA Receive Channels

This field indicates the number of DMA Receive channels:

- 0000: 1 DMA Rx Channel
- 0001: 2 DMA Rx Channels
- ..
- 0111: 8 DMA Rx

Bits 11:10 Reserved, must be kept at reset value.

Bits 9:6 **TXQCNT[3:0]**: Number of MTL Transmit Queues

This field indicates the number of MTL Transmit queues:

- 0000: 1 MTL Tx queue
- 0001: 2 MTL Tx queues
- ..
- 0111: 8 MTL Tx

Bits 5:4 Reserved, must be kept at reset value.

Bits 3:0 **RXQCNT[3:0]**: Number of MTL Receive Queues

This field indicates the number of MTL Receive queues:

- 0000: 1 MTL Rx queue
- 0001: 2 MTL Rx queues
- ..
- 0111: 8 MTL Rx

HW feature 3 register (ETH_MACHWF3R)

Address offset: 0x0128

Reset value: 0x0000 0020

This register indicates the presence of fourth set the optional features or functions of the Ethernet peripheral. The software driver can use this register to dynamically enable or disable the programs related to the optional blocks.

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|------|------|-------|---------|------|------------|------|------|

Bits 31:6 Reserved, must be kept at reset value.

Bit 5 **DVLAN**: Double VLAN processing enable
 This bit is set to 1 when Double VLAN processing is enabled.

Bit 4 **CBTISEL**: Queue/Channel based VLAN tag insertion on Tx enable
 This bit is set to 1 when the Enable Queue/Channel based VLAN tag insertion on Tx feature is selected.

Bit 3 Reserved, must be kept at reset value.

Bits 2:0 **NRVVF[2:0]**: Number of Extended VLAN Tag Filters Enabled
 This field indicates the Number of Extended VLAN Tag Filters selected:
 000: No Extended Rx VLAN Filters
 001: 4 Extended Rx VLAN Filters
 010: 8 Extended Rx VLAN Filters
 011: 16 Extended Rx VLAN Filters
 100: 24 Extended Rx VLAN Filters
 101: 32 Extended Rx VLAN Filters
 110 to 111: Reserved, must not be used

MDIO address register (ETH_MACMDIOAR)

Address offset: 0x0200

Reset value: 0x0000 0000

The MDIO Address register controls the management cycles to external PHY through a management interface.

| | | | | | | | | | | | | | | | |
|------|----------|------|------|---------|-----|---------|----|------|------|----------|------|----------|----|------|----|

| | rw | rw | rw | rw | rw | rw | rw | | | | rw | rw | rw | rw | rw |

Bits 31:28 Reserved, must be kept at reset value.

Bit 27 **PSE**: Preamble Suppression Enable

When this bit is set, the SMA suppresses the 32-bit preamble and transmit MDIO frames with only 1 preamble bit.

When this bit is 0, the MDIO frame always has 32 bits of preamble as defined in the IEEE specifications.

Bit 26 **BTB**: Back to Back transactions

When this bit is set and the NTC has value greater than 0, then the MAC informs the completion of a read or write command at the end of frame transfer (before the trailing clocks are transmitted). The software can thus initiate the next command which is executed immediately irrespective of the number trailing clocks generated for the previous frame.

When this bit is reset, then the read/write command completion (MII busy is cleared) only after the trailing clocks are generated. In this mode, it is ensured that the NTC is always generated after each frame.

This bit must not be set when NTC=0.

Bits 25:21 **PA[4:0]**: Physical Layer Address

This field indicates which Clause 22 PHY devices (out of 32 devices) the MAC is accessing. This field indicates which Clause 45 capable PHYs (out of 32 PHYs) the MAC is accessing.

Bits 20:16 **RDA[4:0]**: Register/Device Address

These bits select the PHY register in selected Clause 22 PHY device. These bits select the Device (MMD) in selected Clause 45 capable PHY.

Bit 15 Reserved, must be kept at reset value.

Bits 14:12 **NTC[2:0]**: Number of Training Clocks

This field controls the number of trailing clock cycles generated on ETH_MDC after the end of transmission of MDIO frame. The valid values can be from 0 to 7. Programming the value to 011 indicates that there are additional three clock cycles on the MDC line after the end of MDIO frame transfer.

Bits 11:8 **CR[3:0]**: CSR Clock Range

The CSR Clock Range selection determines the frequency of the MDC clock according to the CSR clock frequency used in your design:

0000: CSR clock = 60-100 MHz; MDC clock = CSR clock/42

0001: CSR clock = 100-150 MHz; MDC clock = CSR clock/62

0010: CSR clock = 20-35 MHz; MDC clock = CSR clock/16

0011: CSR clock = 35-60 MHz; MDC clock = CSR clock/26

0100: CSR clock = 150-250 MHz; MDC clock = CSR clock/102

0101: CSR clock = 250-300 MHz; MDC clock = CSR clock/124

0110 to 0111: Reserved, must not be used

The suggested range of CSR clock frequency applicable for each value (when Bit 11 = 0) ensures that the MDC clock is approximately between 1.0 MHz to 2.5 MHz frequency range.

When Bit 11 is set, you can achieve a higher frequency of the MDC clock than the frequency limit of 2.5 MHz (specified in the IEEE 802.3) and program a clock divider of lower value. For example, when CSR clock is of 100 MHz frequency and you program these bits to 1010, the resultant MDC clock is of 12.5 MHz which is above the range specified in IEEE 802.3.

Program the following values only if the interfacing chips support faster MDC clocks:

1000: CSR clock/4

1001: CSR clock/6

1010: CSR clock/8

1011: CSR clock/10

1100: CSR clock/12

1101: CSR clock/14

1110: CSR clock/16

1111: CSR clock/18

Bits 7:5 Reserved, must be kept at reset value.

Bit 4 **SKAP**: Skip Address Packet

When this bit is set, the SMA does not send the address packets before read, write, or post-read increment address packets. This bit is valid only when C45E is set.

Bits 3:2 **GOC[1:0]**: MII Operation Command

This bit indicates the operation command to the PHY.

00: Reserved, must not be used

01: Write

10: Post Read Increment Address for Clause 45 PHY

11: Read

When Clause 22 PHY is enabled, only Write and Read commands are valid.

Bit 1 **C45E**: Clause 45 PHY Enable

When this bit is set, Clause 45 capable PHY is connected to MDIO. When this bit is reset, Clause 22 capable PHY is connected to MDIO.

Bit 0 **MB**: MII Busy

The application sets this bit to instruct the SMA to initiate a Read or Write access to the MDIOS. The MAC clears this bit after the MDIO frame transfer is completed. Hence the software must not write or change any of the fields in *MDIO address register (ETH_MACMDIOAR)* and *MDIO data register (ETH_MACMDIODR)* as long as this bit is set.

For write transfers, the application must first write 16-bit data in the MD field (and also RA field when C45E is set) in *MDIO data register (ETH_MACMDIODR)* register before setting this bit. When C45E is set, it should also write into the RA field of *MDIO data register (ETH_MACMDIODR)* before initiating a read transfer. When a read transfer is completed (MII busy=0), the data read from the PHY register is valid in the MD field of the *MDIO data register (ETH_MACMDIODR)*.

Note: Even if the addressed PHY is not present, there is no change in the functionality of this bit.

MDIO data register (ETH_MACMDIODR)

Address offset: 0x0204

Reset value: 0x0000 0000

The MDIO Data register stores the Write data to be written to the PHY register located at the address specified in *MDIO address register (ETH_MACMDIOAR)* This register also stores the Read data from the PHY register located at the address specified by MDIO Address register.

Bits 31:16 **RA[15:0]**: Register Address

This field is valid only when C45E is set. It contains the Register Address in the PHY to which the MDIO frame is intended for.

Bits 15:0 **MD[15:0]**: MII Data

This field contains the 16-bit data value read from the PHY after a Management Read operation or the 16-bit data value to be written to the PHY before a Management Write operation.

ARP address register (ETH_MACARPAR)

Address offset: 0x0210

Reset value: 0x0000 0000

The ARP Address register contains the IPv4 Destination Address of the MAC.

| | | | | | | | | | | | | | | | |
|--------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bits 31:0 **ARPPA[31:0]**: ARP Protocol Address

This field contains the IPv4 Destination Address of the MAC. This address is used for perfect match with the Protocol Address of Target field in the received ARP packet.

CSR software control register (ETH_MACCSRSWCR)

Address offset: 0x0230

Reset value: 0x0000 0000

This register contains software-programmable controls for changing the CSR access response and status bits clearing.

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | | rw | | | | | | | | rw |

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **SEEN**: Slave Error Response Enable

When this bit is set, the MAC responds with a Slave Error for accesses to reserved registers in CSR space.

When this bit is reset, the MAC responds with an Okay response to any register accessed from CSR space.

Bits 7:1 Reserved, must be kept at reset value.

Bit 0 **RCWE**: Register Clear on Write 1 Enable

When this bit is set, the access mode to some register fields changes to rc_w1 (clear on write) meaning that the application needs to set that respective bit to 1 to clear it.

When this bit is reset, the access mode to these register fields remains rc_r (clear on read).

MAC Address 0 high register (ETH_MACA0HR)

Address offset: 0x0300

Reset value: 0x8000 FFFF

The MAC Address0 High register holds the upper 16 bits of the first 6-byte MAC address of the station. The first DA byte that is received on the MII interface corresponds to the LS byte (Bits [7:0]) of the MAC Address Low register. For example, if 0x112233445566 is received (0x11 in lane 0 of the first column) on the MII as the destination address, then the MacAddress0 Register [47:0] is compared with 0x665544332211.

If the MAC address registers are configured to be double-synchronized to the MII clock domains, then the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address0 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

| | | | | | | | | | | | | | | | |

Bit 31 **AE**: Address Enable

This bit is always set to 1.

Bits 30:16 Reserved, must be kept at reset value.

Bits 15:0 **ADDRHI[15:0]**: MAC Address0[47:32]

This field contains the upper 16 bits [47:32] of the first 6-byte MAC address. The MAC uses this field for filtering the received packets and inserting the MAC address in the Transmit Flow Control (Pause) Packets.

MAC Address x low register (ETH_MACAxLR)

Address offset: 0x0304 + 0x8 * x, (x = 0 to 3)

Reset value: 0xFFFF FFFF

The MAC Address x Low register holds the lower 32 bits of the 6-byte first MAC address of the station.

| | | | | | | | | | | | | | | | |

Bits 31:0 **ADDRLO[31:0]**: MAC Address x [31:0] (x = 0 to 3)

This field contains the lower 32 bits of the first 6-byte MAC address. The MAC uses this field for filtering the received packets and inserting the MAC address in the Transmit Flow Control (Pause) Packets.

MAC Address x high register (ETH_MACAxHR)

Address offset: 0x0308 + 0x8 * (x-1), (x = 1 to 3)

Reset value: 0x0000 FFFF

The MAC Address x High register holds the upper 16 bits of the second 6-byte MAC address of the station.

| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | |

Bit 31 **AE**: Address Enable

When this bit is set, the address filter module uses the second MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering.

Bit 30 **SA**: Source Address

When this bit is set, the MAC Addressx[47:0] is used to compare with the SA fields of the received packet. When this bit is reset, the MAC Address x[47:0] is used to compare with the DA fields of the received packet.

- 0: DA
- 1: SA

Bits 29:24 **MBC[5:0]**: Mask Byte Control

These bits are mask control bits for comparing each of the MAC Address bytes. When set high, the MAC does not compare the corresponding byte of received DA or SA with the contents of MAC Address1 registers. Each bit controls the masking of the bytes as follows:

- Bit 29: ETH_MACAxHR[15:8]
- Bit 28: ETH_MACAxHR[7:0]
- Bit 27: ETH_MACAxLR[31:24]
- Bit 26: ETH_MACAxLR[23:16]
- Bit 25: ETH_MACAxLR[15:8]
- Bit 24: ETH_MACAxLR[7:0]

You can filter a group of addresses (known as group address filtering) by masking one or more bytes of the address.

Bits 23:16 Reserved, must be kept at reset value.

Bits 15:0 **ADDRHI[15:0]**: MAC Address1 [47:32]

This field contains the upper 16 bits[47:32] of the second 6-byte MAC address.

MMC control register (ETH_MMC_CONTROL)

Address offset: 0x0700

Reset value: 0x0000 0000

This register configures the MMC operating mode.

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|-------|------|------|------------|---------|----------|---------|-----------|--------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | UCDBC | Res. | Res. | CNTPRSTLVL | CNTPRST | CNTFREEZ | RSTONRD | CNTSTOPRO | CNTRST |
| | | | | | | | rw | | | rw | rw | rw | rw | rw | rw |

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 UCDBC: Update MMC Counters for Dropped Broadcast Packets

The CNTRST bit has a higher priority than the CNTPRST bit. Therefore, when the software tries to set both bits in the same write cycle, all counters are cleared and the CNTPRST bit is not set.

When set, the MAC updates all related MMC Counters for Broadcast packets that are dropped because of the setting of the DBF bit of [Packet filtering control register \(ETH_MACPFR\)](#).

When reset, the MMC Counters are not updated for dropped Broadcast packets.

Bits 7:6 Reserved, must be kept at reset value.

Bit 5 CNTPRSTLVL: Full-Half Preset

When this bit is low and the CNTPRST bit is set, all MMC counters get preset to almost-half value. All octet counters get preset to 0x7FFF_F800 (Half 2Kbytes) and all packet-counters get preset to 0x7FFF_FFF0 (Half 16).

When this bit is high and the CNTPRST bit is set, all MMC counters get preset to almost-full value. All octet counters get preset to 0xFFFF_F800 (Full 2Kbytes) and all packet-counters get preset to 0xFFFF_FFF0 (Full 16).

For 16-bit counters, the almost-half preset values are 0x7800 and 0x7FF0 for the respective octet and packet counters. Similarly, the almost-full preset values for the 16-bit counters are 0xF800 and 0xFF0.

Bit 4 CNTPRST: Counters Preset

When this bit is set, all counters are initialized or preset to almost full or almost half according to the CNTPRSTLVL bit. This bit is cleared automatically after 1 clock cycle.

This bit, along with the CNTPRSTLVL bit, is useful for debugging and testing the assertion of interrupts because of MMC counter becoming half-full or full.

Bit 3 CNTFREEZ: MMC Counter Freeze

When this bit is set, it freezes all MMC counters to their current value.

Until this bit is reset to 0, no MMC counter is updated because of any transmitted or received packet. If any MMC counter is read with the Reset on Read bit set, then that counter is also cleared in this mode.

Bit 2 **RSTONRD**: Reset on Read

When this bit is set, the MMC counters are reset to zero after Read (self-clearing after reset). The counters are cleared when the least significant byte lane (Bits[7:0]) is read.

Bit 1 **CNTSTOPRO**: Counter Stop Rollover

When this bit is set, the counter does not roll over to zero after reaching the maximum value.

Bit 0 **CNTRST**: Counters Reset

When this bit is set, all counters are reset. This bit is cleared automatically after 1 clock cycle.

MMC Rx interrupt register (ETH_MMC_RX_INTERRUPT)

Address offset: 0x0704

Reset value: 0x0000 0000

This register maintains the interrupts generated from all Receive statistics counters.

The MMC Receive Interrupt register maintains the interrupts that are generated when the following occur:

- Receive statistic counters reach half of their maximum values (0x8000_0000 for 32 bit counter and 0x8000 for 16 bit counter).
- Receive statistic counters cross their maximum values (0xFFFF_FFFF for 32 bit counter and 0xFFFF for 16 bit counter).

When the CNTSTOPRO is set in *MMC control register (ETH_MMC_CONTROL)*, interrupts are set but the counter remains at all-ones. The MMC Receive Interrupt register is a 32 bit register. An interrupt bit is cleared when the respective MMC counter that caused the interrupt is read. The least significant byte lane (Bits[7:0]) of the respective counter must be read to clear the interrupt bit.

Bits 31:28 Reserved, must be kept at reset value.

Bit 27 **RXLPITRCIS**: MMC Receive LPI transition counter interrupt status

This bit is set when the *Rx LPI transition counter register (ETH_RX_LPI_TRAN_CNTR)* counter reaches half of the maximum value or the maximum value.

Bit 26 **RXLPUIUSCIS**: MMC Receive LPI microsecond counter interrupt status

This bit is set when the *Rx LPI microsecond counter register (ETH_RX_LPI_USEC_CNTR)* counter reaches half of the maximum value or the maximum value.

Bits 25:18 Reserved, must be kept at reset value.

Bit 17 **RXUCGPIS**: MMC Receive Unicast Good Packet Counter Interrupt Status

This bit is set when the *Rx unicast packets good register (ETH_RX_UNICAST_PACKETS_GOOD)* counter reaches half of the maximum value or the maximum value.

Bits 16:7 Reserved, must be kept at reset value.

Bit 6 **RXALGNERPIS**: MMC Receive Alignment Error Packet Counter Interrupt Status

This bit is set when the *Rx alignment error packets register (ETH_RX_ALIGNMENT_ERROR_PACKETS)* counter reaches half of the maximum value or the maximum value.

Bit 5 **RXCRCERPIS**: MMC Receive CRC Error Packet Counter Interrupt Status

This bit is set when the *Rx CRC error packets register (ETH_RX_CRC_ERROR_PACKETS)* counter reaches half of the maximum value or the maximum value.

Bits 4:0 Reserved, must be kept at reset value.

MMC Tx interrupt register (ETH_MMC_TX_INTERRUPT)

Address offset: 0x0708

Reset value: 0x0000 0000

This register maintains the interrupts generated from all Transmit statistics counters.

The MMC Transmit Interrupt register maintains the interrupts generated when transmit statistic counters reach half their maximum values (0x8000_0000 for 32 bit counter and 0x8000 for 16 bit counter), and when they cross their maximum values (0xFFFF_FFFF for 32-bit counter and 0xFFFF for 16-bit counter).

When CNTSTOPRO is set in *MMC control register (ETH_MMC_CONTROL)*, the interrupts are set but the counter remains at all-ones.

The MMC Transmit Interrupt register is a 32 bit register. An interrupt bit is cleared when the respective MMC counter that caused the interrupt is read.

The least significant byte lane (Bits[7:0]) of the respective counter must be read to clear the interrupt bit.

Bits 31:28 Reserved, must be kept at reset value.

Bit 27 **TXLPITRCIS**: MMC Transmit LPI transition counter interrupt status
This bit is set when the *Tx LPI transition counter register (ETH_TX_LPI_TRAN_CNTR)* counter reaches half of the maximum value or the maximum value.

Bit 26 **TXLPIUSCIS**: MMC Transmit LPI microsecond counter interrupt status
This bit is set when the *Tx LPI microsecond timer register (ETH_TX_LPI_USEC_CNTR)* counter reaches half of the maximum value or the maximum value.

Bits 25:22 Reserved, must be kept at reset value.

Bit 21 **TXGPKTIS**: MMC Transmit Good Packet Counter Interrupt Status
This bit is set when the *Tx packet count good register (ETH_TX_PACKET_COUNT_GOOD)* counter reaches half of the maximum value or the maximum value.

Bits 20:16 Reserved, must be kept at reset value.

Bit 15 **TXMCOGPIS**: MMC Transmit Multiple Collision Good Packet Counter Interrupt Status
This bit is set when the *Tx multiple collision good packets register (ETH_TX_MULTIPLE_COLLISION_GOOD_PACKETS)* counter reaches half of the maximum value or the maximum value.

Bit 14 **TXSCOLGPIS**: MMC Transmit Single Collision Good Packet Counter Interrupt Status
This bit is set when the *Tx single collision good packets register (ETH_TX_SINGLE_COLLISION_GOOD_PACKETS)* counter reaches half of the maximum value or the maximum value.

Bits 13:0 Reserved, must be kept at reset value.

MMC Rx interrupt mask register (ETH_MMC_RX_INTERRUPT_MASK)

Address offset: 0x070C

Reset value: 0x0000 0000

The MMC Receive Interrupt Mask register maintains the masks for the interrupts generated when receive statistic counters reach half of their maximum value or the maximum values.

| | | | | | | | | | | | | | | | |

Bits 31:28 Reserved, must be kept at reset value.

Bit 27 **RXLPI TRCIM**: MMC Receive LPI transition counter interrupt Mask
 Setting this bit masks the interrupt when the *Rx LPI transition counter register (ETH_RX_LPI_TRAN_CNTR)* counter reaches half of the maximum value or the maximum value.

Bit 26 **RXLPI USCIM**: MMC Receive LPI microsecond counter interrupt Mask
 Setting this bit masks the interrupt when the *Rx LPI microsecond counter register (ETH_RX_LPI_USEC_CNTR)* counter reaches half of the maximum value or the maximum value.

Bits 25:18 Reserved, must be kept at reset value.

Bit 17 **RXUCGPIM**: MMC Receive Unicast Good Packet Counter Interrupt Mask
 Setting this bit masks the interrupt when the *Rx unicast packets good register (ETH_RX_UNICAST_PACKETS_GOOD)* counter reaches half of the maximum value or the maximum value.

Bits 16:7 Reserved, must be kept at reset value.

Bit 6 **RXALGNERPIM**: MMC Receive Alignment Error Packet Counter Interrupt Mask
 Setting this bit masks the interrupt when the *Rx alignment error packets register (ETH_RX_ALIGNMENT_ERROR_PACKETS)* counter reaches half of the maximum value or the maximum value.

Bit 5 **RXCRCERPIM**: MMC Receive CRC Error Packet Counter Interrupt Mask
 Setting this bit masks the interrupt when the *Rx CRC error packets register (ETH_RX_CRC_ERROR_PACKETS)* counter reaches half of the maximum value or the maximum value.

Bits 4:0 Reserved, must be kept at reset value.

MMC Tx interrupt mask register (ETH_MMC_TX_INTERRUPT_MASK)

Address offset: 0x0710

Reset value: 0x0000 0000

The MMC Transmit Interrupt Mask register maintains the masks for the interrupts generated when the transmit statistic counters reach half of their maximum value or the maximum values. This register is 32 bit wide.

Bit 27 **TXLPITRCIM**: MMC Transmit LPI transition counter interrupt Mask
 Setting this bit masks the interrupt when the *Tx LPI transition counter register (ETH_TX_LPI_TRAN_CNTR)* counter reaches half of the maximum value or the maximum value.

Bit 26 **TXLPIUSCIM**: MMC Transmit LPI microsecond counter interrupt Mask
 Setting this bit masks the interrupt when the *Tx LPI microsecond timer register (ETH_TX_LPI_USEC_CNTR)* counter reaches half of the maximum value or the maximum value.

Bits 25:22 Reserved, must be kept at reset value.

Bit 21 **TXGPKTIM**: MMC Transmit Good Packet Counter Interrupt Mask
 Setting this bit masks the interrupt when the *Tx packet count good register (ETH_TX_PACKET_COUNT_GOOD)* counter reaches half of the maximum value or the maximum value.

Bits 20:16 Reserved, must be kept at reset value.

Bit 15 **TXMCOLGPIM**: MMC Transmit Multiple Collision Good Packet Counter Interrupt Mask
 Setting this bit masks the interrupt when the *Tx multiple collision good packets register (ETH_TX_MULTIPLE_COLLISION_GOOD_PACKETS)* counter reaches half of the maximum value or the maximum value.

Bit 14 **TXSCOLGPIM**: MMC Transmit Single Collision Good Packet Counter Interrupt Mask
 Setting this bit masks the interrupt when the *Tx single collision good packets register (ETH_TX_SINGLE_COLLISION_GOOD_PACKETS)* counter reaches half of the maximum value or the maximum value.

Bits 13:0 Reserved, must be kept at reset value.

**Tx single collision good packets register
(ETH_TX_SINGLE_COLLISION_GOOD_PACKETS)**

Address offset: 0x074C

Reset value: 0x0000 0000

This register provides the number of successfully transmitted packets by Ethernet peripheral after a single collision in the Half-duplex mode.

| | | | | | | | | | | | | | | | |
|-------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bits 31:0 **TXSNGLCOLG[31:0]**: Tx Single Collision Good Packets

This field indicates the number of successfully transmitted packets after a single collision in the Half-duplex mode.

**Tx multiple collision good packets register
(ETH_TX_MULTIPLE_COLLISION_GOOD_PACKETS)**

Address offset: 0x0750

Reset value: 0x0000 0000

This register provides the number of successfully transmitted packets by Ethernet peripheral after multiple collisions in the Half-duplex mode.

| | | | | | | | | | | | | | | | |
|-------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:0 **TXMULTCOLG[31:0]**: Tx Multiple Collision Good Packets

This field indicates the number of successfully transmitted packets after multiple collisions in the Half-duplex mode.

Tx packet count good register (ETH_TX_PACKET_COUNT_GOOD)

Address offset: 0x0768

Reset value: 0x0000 0000

This register provides the number of good packets transmitted by Ethernet peripheral.

| | | | | | | | | | | | | | | | |
|---------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| TXPKTG[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:0 **TXPKTG[31:0]**: Tx Packet Count Good

This field indicates the number of good packets transmitted.

Rx CRC error packets register (ETH_RX_CRC_ERROR_PACKETS)

Address offset: 0x0794

Reset value: 0x0000 0000

This register provides the number of packets received by Ethernet peripheral with CRC error.

| | | | | | | | | | | | | | | | |
|-----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| RXCRCERR[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:0 **RXCRCERR[31:0]**: Rx CRC Error Packets

This field indicates the number of packets received with CRC error.

Rx alignment error packets register (ETH_RX_ALIGNMENT_ERROR_PACKETS)

Address offset: 0x0798

Reset value: 0x0000 0000

This register provides the number of packets received by Ethernet peripheral with alignment (dribble) error. It is valid only in 10/100 mode.

| | | | | | | | | | | | | | | | |
|------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| RXALGNERR[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:0 **RXALGNERR[31:0]**: Rx Alignment Error Packets

This field indicates the number of packets received with alignment (dribble) error. It is valid only in 10/100 mode.

Rx unicast packets good register (ETH_RX_UNICAST_PACKETS_GOOD)

Address offset: 0x07C4

Reset value: 0x0000 0000

This register provides the number of good unicast packets received by Ethernet peripheral.

| | | | | | | | | | | | | | | | |
|-------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| RXUNICASTG[31:16] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RXUNICASTG[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:0 **RXUNICASTG[31:0]**: Rx Unicast Packets Good

This field indicates the number of good unicast packets received.

Tx LPI microsecond timer register (ETH_TX_LPI_USEC_CNTR)

Address offset: 0x07EC

Reset value: 0x0000 0000

This register provides the number of microseconds Tx LPI is asserted by Ethernet peripheral.

| | | | | | | | | | | | | | | | |
|-----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| TXLPIUSC[31:16] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| TXLPIUSC[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:0 **TXLPIUSC[31:0]**: Tx LPI Microseconds Counter

This field indicates the number of microseconds Tx LPI is asserted. For every Tx LPI Entry and Exit, the Timer value can have an error of +/- 1 microsecond.

Tx LPI transition counter register (ETH_TX_LPI_TRAN_CNTR)

Address offset: 0x07F0

Reset value: 0x0000 0000

This register provides the number of times Ethernet peripheral has entered Tx LPI.

| | | | | | | | | | | | | | | | |
|-----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| TXLPITRC[31:16] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| TXLPITRC[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:0 **TXLPITRC[31:0]**: Tx LPI Transition counter

This field indicates the number of times Tx LPI Entry has occurred. Even if Tx LPI Entry occurs in Automate mode (because of LPITXA bit set in the *LPI control and status register (ETH_MACLCSR)*), the counter is incremented.

Rx LPI microsecond counter register (ETH_RX_LPI_USEC_CNTR)

Address offset: 0x07F4

Reset value: 0x0000 0000

This register provides the number of microseconds Rx LPI is sampled by Ethernet peripheral.

| | | | | | | | | | | | | | | | |
|-----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| RXLPIUSC[31:16] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RXLPIUSC[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:0 **RXLPIUSC[31:0]**: Rx LPI Microseconds Counter

This field indicates the number of microseconds Rx LPI is asserted. For every Rx LPI Entry and Exit, the Timer value can have an error of +/- 1 microsecond.

Rx LPI transition counter register (ETH_RX_LPI_TRAN_CNTR)

Address offset: 0x07F8

Reset value: 0x0000 0000

This register provides the number of times Ethernet peripheral has entered Rx LPI.

| | | | | | | | | | | | | | | | |
|-----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| RXLPITRC[31:16] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

| RXLPITRC[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:0 **RXLPITRC[31:0]**: Rx LPI Transition counter

This field indicates the number of times Rx LPI Entry has occurred.

L3 and L4 control 0 register (ETH_MACL3L4C0R)

Address offset: 0x0900

Reset value: 0x0000 0000

The Layer 3 and Layer 4 Control register controls the operations of filter 0 of Layer 3 and Layer 4.

| | | | | | | | | | | | | | | | |
|--------------|------|------|------|------|--------------|------|------|------|------|---------|--------|---------|--------|------|--------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | L4DPIM0 | L4DPM0 | L4SPIM0 | L4SPM0 | Res. | L4PEN0 |
| | | | | | | | | | | rw | rw | rw | rw | | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | | rw |

Bits 31:22 Reserved, must be kept at reset value.

Bit 21 **L4DPIM0**: Layer 4 Destination Port Inverse Match Enable

When this bit is set, the Layer 4 Destination Port number field is enabled for inverse matching. When this bit is reset, the Layer 4 Destination Port number field is enabled for perfect matching.

This bit is valid and applicable only when the L4DPM0 bit is set high.

Bit 20 **L4DPM0**: Layer 4 Destination Port Match Enable

When this bit is set, the Layer 4 Destination Port number field is enabled for matching. When this bit is reset, the MAC ignores the Layer 4 Destination Port number field for matching.

Bit 19 **L4SPIM0**: Layer 4 Source Port Inverse Match Enable

When this bit is set, the Layer 4 Source Port number field is enabled for inverse matching. When this bit is reset, the Layer 4 Source Port number field is enabled for perfect matching.

This bit is valid and applicable only when the L4SPM0 bit is set high.

Bit 18 **L4SPM0**: Layer 4 Source Port Match Enable

When this bit is set, the Layer 4 Source Port number field is enabled for matching. When this bit is reset, the MAC ignores the Layer 4 Source Port number field for matching.

Bit 17 Reserved, must be kept at reset value.

Bit 16 **L4PEN0**: Layer 4 Protocol Enable

When this bit is set, the Source and Destination Port number fields of UDP packets are used for matching. When this bit is reset, the Source and Destination Port number fields of TCP packets are used for matching.

The Layer 4 matching is done only when the L4SPM0 or L4DPM0 bit is set.

Bits 15:11 **L3HDBM0[4:0]**: Layer 3 IP DA higher bits match

Condition: IPv4 packets

This field contains the number of higher bits of IP Destination Address that are masked in the IPv4 packets:

0: No bits are masked.

1: LSb[0] is masked

2: Two LSbs [1:0] are masked

..

31: All bits except MSb are masked.

Condition: IPv6 packets

Bits[12:11] of this field correspond to Bits[6:5] of L3HSBM0 which indicate the number of lower bits of IP Source or Destination Address that are masked in the IPv6 packets. Number of bits masked is given by concatenated values of the L3HDBM0[1:0] and L3HSBM0 bits:

0: No bits are masked.

1: LSb[0] is masked

2: Two LSbs [1:0] are masked

..

31: All bits except MSb are masked.

This field is valid and applicable only when the L3DAM0 or L3SAM0 bit is set.

Bits 10:6 **L3HSBM0[4:0]**: Layer 3 IP SA higher bits match

Condition: IPv4 packets

This field contains the number of lower bits of IP source address that are masked for matching in the IPv4 packets. The following list describes the values of this field:

0: No bits are masked.

1: LSb[0] is masked

2: Two LSbs [1:0] are masked

..

31: All bits except MSb are masked.

Condition: IPv6 packets:

This field contains Bits[4:0] of L3HSBM0. These bits indicate the number of higher bits of IP source or destination address matched in the IPv6 packets. This field is valid and applicable only when the L3DAM0 or L3SAM0 bit is set high.

Bit 5 **L3DAIM0**: Layer 3 IP DA Inverse Match Enable

When this bit is set, the Layer 3 IP Destination Address field is enabled for inverse matching. When this bit is reset, the Layer 3 IP Destination Address field is enabled for perfect matching.

This bit is valid and applicable only when the L3DAM0 bit is set high.

Bit 4 **L3DAM0**: Layer 3 IP DA Match Enable

When this bit is set, the Layer 3 IP Destination Address field is enabled for matching. When this bit is reset, the MAC ignores the Layer 3 IP Destination Address field for matching.

Note: When the L3PEN0 bit is set, you should set either this bit or the L3SAM0 bit because either IPv6 DA or SA can be checked for filtering.

Bit 3 **L3SAIM0**: Layer 3 IP SA Inverse Match Enable

When this bit is set, the Layer 3 IP Source Address field is enabled for inverse matching.

When this bit reset, the Layer 3 IP Source Address field is enabled for perfect matching.

This bit is valid and applicable only when the L3SAM0 bit is set.

Bit 2 **L3SAM0**: Layer 3 IP SA Match Enable

When this bit is set, the Layer 3 IP Source Address field is enabled for matching. When this bit is reset, the MAC ignores the Layer 3 IP Source Address field for matching.

Note: When the L3PEN0 bit is set, you should set either this bit or the L3DAM0 bit because either IPv6 SA or DA can be checked for filtering.

Bit 1 Reserved, must be kept at reset value.

Bit 0 **L3PEN0**: Layer 3 Protocol Enable

When this bit is set, the Layer 3 IP Source or Destination Address matching is enabled for IPv6 packets. When this bit is reset, the Layer 3 IP Source or Destination Address matching is enabled for IPv4 packets.

The Layer 3 matching is done only when the L3SAM0 or L3DAM0 bit is set.

Layer4 Address filter 0 register (ETH_MACL4A0R)

Address offset: 0x0904

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| L4DP0[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

| L4SP0[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:16 **L4DP0[15:0]**: Layer 4 Destination Port Number Field

When the L4PEN0 bit is reset and the L4DPM0 bit is set in the [L3 and L4 control 0 register \(ETH_MACL3L4C0R\)](#), this field contains the value to be matched with the TCP Destination Port Number field in the IPv4 or IPv6 packets.

When the L4PEN0 and L4DPM0 bits are set in [L3 and L4 control 0 register \(ETH_MACL3L4C0R\)](#), this field contains the value to be matched with the UDP Destination Port Number field in the IPv4 or IPv6 packets.

Bits 15:0 **L4SP0[15:0]**: Layer 4 Source Port Number Field

When the L4PEN0 bit is reset and the L4DPM0 bit is set in the [L3 and L4 control 0 register \(ETH_MACL3L4C0R\)](#), this field contains the value to be matched with the TCP Source Port Number field in the IPv4 or IPv6 packets.

When the L4PEN0 and L4DPM0 bits are set in [L3 and L4 control 0 register \(ETH_MACL3L4C0R\)](#), this field contains the value to be matched with the UDP Source Port Number field in the IPv4 or IPv6 packets.

Layer3 Address 0 filter 0 register (ETH_MACL3A00R)

Address offset: 0x0910

Reset value: 0x0000 0000

For IPv4 packets, the Layer 3 Address 0 filter 0 register contains the 32-bit IP Source Address field. For IPv6 packets, it contains Bits[31:0] of the 128-bit IP Source Address or Destination Address field.

| | | | | | | | | | | | | | | | |

Bits 31:0 **L3A00[31:0]**: Layer 3 Address 0 Field

When the L3PEN0 and L3SAM0 bits are set in the [L3 and L4 control 0 register \(ETH_MACL3L4C0R\)](#), this field contains the value to be matched with Bits[31:0] of the IP Source Address field in the IPv6 packets.

When the L3PEN0 and L3DAM0 bits are set in the [L3 and L4 control 0 register \(ETH_MACL3L4C0R\)](#), this field contains the value to be matched with Bits[31:0] of the IP Destination Address field in the IPv6 packets.

When the L3PEN0 bit is reset and the L3SAM0 bit is set in the [L3 and L4 control 0 register \(ETH_MACL3L4C0R\)](#), this field contains the value to be matched with the IP Source Address field in the IPv4 packets.

Layer3 Address 1 filter 0 register (ETH_MACL3A10R)

Address offset: 0x0914

Reset value: 0x0000 0000

For IPv4 packets, the Layer 3 Address 1 filter 0 register contains the 32-bit IP Destination Address field. For IPv6 packets, it contains Bits[63:32] of the 128-bit IP Source Address or Destination Address field.

| | | | | | | | | | | | | | | | |

Bits 31:0 **L3A10[31:0]**: Layer 3 Address 1 Field

When the L3PEN0 and L3SAM0 bits are set in the *L3 and L4 control 0 register (ETH_MACL3L4C0R)*, this field contains the value to be matched with Bits[63:32] of the IP Source Address field in the IPv6 packets.

When the L3PEN0 and L3DAM0 bits are set in the *L3 and L4 control 0 register (ETH_MACL3L4C0R)*, this field contains the value to be matched with Bits[63:32] of the IP Destination Address field in the IPv6 packets.

When the L3PEN0 bit is reset and the L3SAM0 bit is set in the *L3 and L4 control 0 register (ETH_MACL3L4C0R)*, this field contains the value to be matched with the IP Destination Address field in the IPv4 packets.

Layer3 Address 2 filter 0 register (ETH_MACL3A20R)

Address offset: 0x0918

Reset value: 0x0000 0000

The Layer 3 Address 2 filter 0 register is reserved for IPv4 packets. For IPv6 packets, it contains Bits[95:64] of 128-bit IP Source Address or Destination Address field.

| | | | | | | | | | | | | | | | |

Bits 31:0 **L3A20[31:0]**: Layer 3 Address 2 Field

When the L3PEN0 and L3SAM0 bits are set in the *L3 and L4 control 0 register (ETH_MACL3L4C0R)*, this field contains the value to be matched with Bits[95:64] of the IP Source Address field in the IPv6 packets.

When the L3PEN0 and L3DAM0 bits are set in the *L3 and L4 control 0 register (ETH_MACL3L4C0R)*, this field contains the value to be matched with Bits[95:64] of the IP Destination Address field in the IPv6 packets.

When the L3PEN0 bit is reset in the *L3 and L4 control 0 register (ETH_MACL3L4C0R)*, this field is not used.

Layer3 Address 3 filter 0 register (ETH_MACL3A30R)

Address offset: 0x091C

Reset value: 0x0000 0000

The Layer 3 Address 3 filter 0 register is reserved for IPv4 packets. For IPv6 packets, it contains Bits[127:96] of 128-bit IP Source Address or Destination Address field.

| | | | | | | | | | | | | | | | |

Bits 31:0 **L3A30[31:0]**: Layer 3 Address 3 Field

When the L3PEN0 and L3SAM0 bits are set in the *L3 and L4 control 0 register (ETH_MACL3L4C0R)*, this field contains the value to be matched with Bits[127:96] of the IP Source Address field in the IPv6 packets.

When the L3PEN0 and L3DAM0 bits are set in the *L3 and L4 control 0 register (ETH_MACL3L4C0R)*, this field contains the value to be matched with Bits[127:96] of the IP Destination Address field in the IPv6 packets.

When the L3PEN0 bit is reset in the *L3 and L4 control 0 register (ETH_MACL3L4C0R)*, this field is not used.

L3 and L4 control 1 register (ETH_MACL3L4C1R)

Address offset: 0x0930

Reset value: 0x0000 0000

The Layer 3 and Layer 4 Control register controls the operations of filter 1 of Layer 3 and Layer 4.

Bits 31:22 Reserved, must be kept at reset value.

Bit 21 **L4DPIM1**: Layer 4 Destination Port Inverse Match Enable

When this bit is set, the Layer 4 Destination Port number field is enabled for inverse matching. When this bit is reset, the Layer 4 Destination Port number field is enabled for perfect matching.

This bit is valid and applicable only when the L4DPM1 bit is set high.

Bit 20 **L4DPM1**: Layer 4 Destination Port Match Enable

When this bit is set, the Layer 4 Destination Port number field is enabled for matching. When this bit is reset, the MAC ignores the Layer 4 Destination Port number field for matching.

Bit 19 **L4SPIM1**: Layer 4 Source Port Inverse Match Enable

When this bit is set, the Layer 4 Source Port number field is enabled for inverse matching. When this bit is reset, the Layer 4 Source Port number field is enabled for perfect matching. This bit is valid and applicable only when the L4SPM1 bit is set high.

Bit 18 **L4SPM1**: Layer 4 Source Port Match Enable

When this bit is set, the Layer 4 Source Port number field is enabled for matching. When this bit is reset, the MAC ignores the Layer 4 Source Port number field for matching.

Bit 17 Reserved, must be kept at reset value.

Bit 16 **L4PEN1**: Layer 4 Protocol Enable

When this bit is set, the Source and Destination Port number fields of UDP packets are used for matching. When this bit is reset, the Source and Destination Port number fields of TCP packets are used for matching.

The Layer 4 matching is done only when the L4SPM1 or L4DPM1 bit is set.

Bits 15:11 **L3HDBM1[4:0]**: Layer 3 IP DA higher bits match

Condition: IPv4 packets

This field contains the number of lower bits of IP Destination Address that are masked for matching in the IPv4 packets. The following list describes the values of this field:

0: No bits are masked.

1: LSb[0] is masked

2: Two LSbs [1:0] are masked

..

31: All bits except MSb are masked.

Condition: IPv6 packets

Bits[12:11] of this field correspond to Bits[6:5] of L3HSBM1, which indicate the number of lower bits of IP Source or Destination Address that are masked in the IPv6 packets. The following list describes the concatenated values of the L3HDBM1[1:0] and L3HSBM1 bits:

0: No bits are masked

1: LSb[0] is masked

2: Two LSbs [1:0] are masked

..

127: All bits except MSb are masked

This field is valid and applicable only when the L3DAM1 or L3SAM1 bit is set.

Bits 10:6 **L3HSBM1[4:0]**: Layer 3 IP SA Higher Bits Match

Condition: IPv4 packets

This field contains the number of lower bits of IP Source Address that are masked for matching in the IPv4 packets. The following list describes the values of this field:

0: No bits are masked.

1: LSb[0] is masked

2: Two LSbs [1:0] are masked

..

31: All bits except MSb are masked.

Condition: IPv6 packets

This field contains Bits[4:0] of L3HSBM1. These bits indicate the number of higher bits of IP Source or Destination Address matched in the IPv6 packets. This field is valid and applicable only when the L3DAM1 or L3SAM1 bit is set high.

Bit 5 **L3DAIM1**: Layer 3 IP DA Inverse Match Enable

When this bit is set, the Layer 3 IP Destination Address field is enabled for inverse matching. When this bit is reset, the Layer 3 IP Destination Address field is enabled for perfect matching.

This bit is valid and applicable only when the L3DAM1 bit is set high.

Bit 4 **L3DAM1**: Layer 3 IP DA Match Enable

When this bit is set, the Layer 3 IP Destination Address field is enabled for matching. When this bit is reset, the MAC ignores the Layer 3 IP Destination Address field for matching.

Note: When the L3PEN1 bit is set, you should set either this bit or the L3SAM1 bit because either IPv6 DA or SA can be checked for filtering.

Bit 3 **L3SAIM1**: Layer 3 IP SA Inverse Match Enable

When this bit is set, the Layer 3 IP Source Address field is enabled for inverse matching.
 When this bit reset, the Layer 3 IP Source Address field is enabled for perfect matching.
 This bit is valid and applicable only when the L3SAM1 bit is set.

Bit 2 **L3SAM1**: Layer 3 IP SA Match Enable

When this bit is set, the Layer 3 IP Source Address field is enabled for matching. When this bit is reset, the MAC ignores the Layer 3 IP Source Address field for matching.

Note: When the L3PEN01 bit is set, you should set either this bit or the L3DAM1 bit because either IPv6 SA or DA can be checked for filtering.

Bit 1 Reserved, must be kept at reset value.

Bit 0 **L3PEN1**: Layer 3 Protocol Enable

When this bit is set, the Layer 3 IP Source or Destination Address matching is enabled for IPv6 packets. When this bit is reset, the Layer 3 IP Source or Destination Address matching is enabled for IPv4 packets.

The Layer 3 matching is done only when the L3SAM1 or L3DAM1 bit is set.

Layer 4 address filter 1 register (ETH_MACL4A1R)

Address offset: 0x0934

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

Bits 31:16 **L4DP1[15:0]**: Layer 4 Destination Port Number Field

When the L4PEN1 bit is reset and the L4DPM1 bit is set in the [L3 and L4 control 1 register \(ETH_MACL3L4C1R\)](#), this field contains the value to be matched with the TCP Destination Port Number field in the IPv4 or IPv6 packets.

When the L4PEN1 and L4DPM1 bits are set in [L3 and L4 control 1 register \(ETH_MACL3L4C1R\)](#), this field contains the value to be matched with the UDP Destination Port Number field in the IPv4 or IPv6 packets.

Bits 15:0 **L4SP1[15:0]**: Layer 4 Source Port Number Field

When the L4PEN1 bit is reset and the L4DPM1 bit is set in the [L3 and L4 control 1 register \(ETH_MACL3L4C1R\)](#), this field contains the value to be matched with the TCP Source Port Number field in the IPv4 or IPv6 packets.

When the L4PEN1 and L4DPM1 bits are set in [L3 and L4 control 1 register \(ETH_MACL3L4C1R\)](#), this field contains the value to be matched with the UDP Source Port Number field in the IPv4 or IPv6 packets.

Layer3 address 0 filter 1 Register (ETH_MACL3A01R)

Address offset: 0x0940

Reset value: 0x0000 0000

For IPv4 packets, the Layer 3 Address 0 filter 1 register contains the 32-bit IP Source Address field. For IPv6 packets, it contains Bits[31:0] of the 128-bit IP Source Address or Destination Address field.

| | | | | | | | | | | | | | | | |

| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **L3A01[31:0]**: Layer 3 Address 0 Field

When the L3PEN1 and L3SAM1 bits are set in the [L3 and L4 control 1 register \(ETH_MACL3L4C1R\)](#), this field contains the value to be matched with Bits[31:0] of the IP Source Address field in the IPv6 packets.

When the L3PEN1 and L3DAM1 bits are set in the [L3 and L4 control 1 register \(ETH_MACL3L4C1R\)](#), this field contains the value to be matched with Bits[31:0] of the IP Destination Address field in the IPv6 packets.

When the L3PEN1 bit is reset and the L3SAM1 bit is set in the [L3 and L4 control 1 register \(ETH_MACL3L4C1R\)](#), this field contains the value to be matched with the IP Source Address field in the IPv4 packets.

Layer3 address 1 filter 1 register (ETH_MACL3A11R)

Address offset: 0x0944

Reset value: 0x0000 0000

For IPv4 packets, the Layer 3 Address 1 filter 1 register contains the 32-bit IP Destination Address field. For IPv6 packets, it contains Bits[63:32] of the 128-bit IP Source Address or Destination Address field.

| | | | | | | | | | | | | | | | |
|--------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **L3A11[31:0]**: Layer 3 Address 1 Field

When the L3PEN1 and L3SAM1 bits are set in the *L3 and L4 control 1 register (ETH_MACL3L4C1R)*, this field contains the value to be matched with Bits[63:32] of the IP Source Address field in the IPv6 packets.

When the L3PEN1 and L3DAM1 bits are set in the *L3 and L4 control 1 register (ETH_MACL3L4C1R)*, this field contains the value to be matched with Bits[63:32] of the IP Destination Address field in the IPv6 packets.

When the L3PEN1 bit is reset and the L3SAM1 bit is set in the *L3 and L4 control 1 register (ETH_MACL3L4C1R)*, this field contains the value to be matched with the IP Destination Address field in the IPv4 packets.

Layer3 address 2 filter 1 Register (ETH_MACL3A21R)

Address offset: 0x0948

Reset value: 0x0000 0000

The Layer 3 Address 2 filter 1 register is reserved for IPv4 packets. For IPv6 packets, it contains Bits[95:64] of 128-bit IP Source Address or Destination Address field.

| | | | | | | | | | | | | | | | |
|--------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bits 31:0 **L3A21[31:0]**: Layer 3 Address 2 Field

When the L3PEN1 and L3SAM1 bits are set in the *L3 and L4 control 1 register (ETH_MACL3L4C1R)*, this field contains the value to be matched with Bits[95:64] of the IP Source Address field in the IPv6 packets.

When the L3PEN1 and L3DAM1 bits are set in the *L3 and L4 control 1 register (ETH_MACL3L4C1R)*, this field contains the value to be matched with Bits[95:64] of the IP Destination Address field in the IPv6 packets.

When the L3PEN1 bit is reset in the *L3 and L4 control 1 register (ETH_MACL3L4C1R)*, this field is not used.

Layer3 address 3 filter 1 register (ETH_MACL3A31R)

Address offset: 0x94C

Reset value: 0x0000 0000

The Layer 3 Address 3 filter 1 register is reserved for IPv4 packets. For IPv6 packets, it contains Bits[127:96] of 128-bit IP Source Address or Destination Address field.

| | | | | | | | | | | | | | | | |
|--------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bits 31:0 **L3A31[31:0]**: Layer 3 Address 3 Field

When the L3PEN1 and L3SAM1 bits are set in the *L3 and L4 control 1 register (ETH_MACL3L4C1R)*, this field contains the value to be matched with Bits[127:96] of the IP Source Address field in the IPv6 packets.

When the L3PEN1 and L3DAM1 bits are set in the *L3 and L4 control 1 register (ETH_MACL3L4C1R)*, this field contains the value to be matched with Bits[127:96] of the IP Destination Address field in the IPv6 packets.

When the L3PEN1 bit is reset in the *L3 and L4 control 1 register (ETH_MACL3L4C1R)*, this field is not used.

Timestamp control Register (ETH_MACTSCR)

Address offset: 0x0B00

Reset value: 0x0000 2000

This register controls the operation of the System Time generator and processing of PTP packets for timestamping in the Receiver.

| | | | | | | | | | | | | | | | |
|-----------|------------|-----------|-------------|---------|-----------|-----------|----------|------|------|-----------|------|--------|-----------|-----------------|-------|

| rW | rW | rW | rW | rW | rW | rW | rW | | | rW | | rW | rW | rW | rW |

Bits 31:29 Reserved, must be kept at reset value.

Bit 28 **AV8021ASMEN**: AV 802.1AS Mode Enable

When this bit is set, the MAC processes only untagged PTP over Ethernet packets for providing PTP status and capturing timestamp snapshots, that is, IEEE 802.1AS operating mode.

When PTP offload feature is enabled, for the purpose of PTP offload, the transport specific field in the PTP header is generated and checked based on the value of this bit.

Bits 27:25 Reserved, must be kept at reset value.

Bit 24 **TXTSSTSM**: Transmit Timestamp Status Mode

When this bit is set, the MAC overwrites the earlier transmit timestamp status even if it is not read by the software. The MAC indicates this by setting the TXTSSMIS bit of the *Tx timestamp status nanoseconds register (ETH_MACTXTSSNR)* register.

When this bit is reset, the MAC ignores the timestamp status of current packet if the timestamp status of previous packet is not read by the software. The MAC indicates this by setting the TXTSSMIS bit of the *Tx timestamp status nanoseconds register (ETH_MACTXTSSNR)*.

Bits 23:19 Reserved, must be kept at reset value.

- Bit 18 **TSENMADDR**: Enable MAC Address for PTP Packet Filtering
When this bit is set, the DA MAC address (that matches any MAC Address register) is used to filter the PTP packets when PTP is directly sent over Ethernet.
When this bit is set, received PTP packets with DA containing a special multicast or unicast address that matches the one programmed in MAC address registers are considered for processing as indicated below, when PTP is directly sent over Ethernet.
For normal timestamping operation, MAC address registers 0 to 31 is considered for unicast destination address matching.
For PTP offload, only MAC address register 0 is considered for unicast destination address matching.
- Bits 17:16 **SNAPTYPSEL[1:0]**: Select PTP packets for Taking Snapshots
These bits, along with Bits 15 and 14, define the set of PTP packet types for which snapshot needs to be taken. The encoding is given in [Table 540: Timestamp Snapshot Dependency on ETH_MACTSCR bits](#).
- Bit 15 **TSMSTRENA**: Enable Snapshot for Messages Relevant to Master
When this bit is set, the snapshot is taken only for the messages that are relevant to the master node. Otherwise, the snapshot is taken for the messages relevant to the slave node.
- Bit 14 **TSEVENTENA**: Enable Timestamp Snapshot for Event Messages
When this bit is set, the timestamp snapshot is taken only for event messages (SYNC, Delay_Req, Pdelay_Req, or Pdelay_Resp). When this bit is reset, the snapshot is taken for all messages except Announce, Management, and Signaling. For more information about the timestamp snapshots, see [Table 540: Timestamp Snapshot Dependency on ETH_MACTSCR bits](#).
- Bit 13 **TSIPV4ENA**: Enable Processing of PTP Packets Sent over IPv4-UDP
When this bit is set, the MAC receiver processes the PTP packets encapsulated in IPv4-UDP packets. When this bit is reset, the MAC ignores the PTP transported over IPv4-UDP packets. This bit is set by default.
- Bit 12 **TSIPV6ENA**: Enable Processing of PTP Packets Sent over IPv6-UDP
When this bit is set, the MAC receiver processes the PTP packets encapsulated in IPv6-UDP packets. When this bit is clear, the MAC ignores the PTP transported over IPv6-UDP packets.
- Bit 11 **TSIPENA**: Enable Processing of PTP over Ethernet Packets
When this bit is set, the MAC receiver processes the PTP packets encapsulated directly in the Ethernet packets. When this bit is reset, the MAC ignores the PTP over Ethernet packets.
- Bit 10 **TSVER2ENA**: Enable PTP Packet Processing for Version 2 Format
When this bit is set, the IEEE 1588 version 2 format is used to process the PTP packets.
When this bit is reset, the IEEE 1588 version 1 format is used to process the PTP packets.
The IEEE 1588 formats are described in 'PTP Processing and Control'.
- Bit 9 **TSCTRLSSR**: Timestamp Digital or Binary Rollover Control
When this bit is set, the Timestamp Low register rolls over after 0x3B9A_C9FF value (that is, 1 nanosecond accuracy) and increments the timestamp (High) seconds. When this bit is reset, the rollover value of subsecond register is 0x7FFF_FFFF. The subsecond increment must be programmed correctly depending on the PTP reference clock frequency and the value of this bit.
- Bit 8 **TSEBALL**: Enable Timestamp for All Packets
When this bit is set, the timestamp snapshot is enabled for all packets received by the MAC.
- Bits 7:6 Reserved, must be kept at reset value.

- Bit 5 **TSADDREG**: Update Addend Register
 When this bit is set, the content of the Timestamp Addend register is updated in the PTP block for fine correction. This bit is cleared when the update is complete. This bit should be zero before it is set.
- Bit 4 Reserved, must be kept at reset value.
- Bit 3 **TSUPDT**: Update Timestamp
 When this bit is set, the system time is updated (added or subtracted) with the value specified in [System time seconds update register \(ETH_MACSTSUR\)](#) and [System time nanoseconds update register \(ETH_MACSTNUR\)](#).
 This bit should be zero before updating it. This bit is reset when the update is complete in hardware.
- Bit 2 **TSINIT**: Initialize Timestamp
 When this bit is set, the system time is initialized (overwritten) with the value specified in the [System time seconds update register \(ETH_MACSTSUR\)](#) and [System time nanoseconds update register \(ETH_MACSTNUR\)](#).

 This bit should be zero before it is updated. This bit is reset when the initialization is complete.
- Bit 1 **TSCFUPDT**: Fine or Coarse Timestamp Update
 When this bit is set, the Fine method is used to update system timestamp. When this bit is reset, Coarse method is used to update the system timestamp.
- Bit 0 **TSENA**: Enable Timestamp
 When this bit is set, the timestamp is added for Transmit and Receive packets. When disabled, timestamp is not added for transmit and receive packets and the Timestamp Generator is also suspended. You need to initialize the Timestamp (system time) after enabling this mode.
 On the Receive side, the MAC processes the 1588 packets only if this bit is set.

Subsecond increment register (ETH_MACSSIR)

Address offset: 0x0B04

Reset value: 0x0000 0000

In Coarse Update mode (bit TSCFUPDT in [Timestamp control Register \(ETH_MACTSCR\)](#)), the value in this register is added to the system time every clock cycle of clk_ptp_ref_i. In Fine Update mode, the value in this register is added to the system time whenever the Accumulator gets an overflow.

| | | | | | | | | | | | | | | | |

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:16 **SSINC[7:0]**: Subsecond Increment Value

The value programmed in this field is accumulated every clock cycle (of `clk_ptp_i`) with the contents of the subsecond register. For example, when the PTP clock is 50 MHz (period is 20 ns), you should program 20 (0x14) when the System Time Nanoseconds register has an accuracy of 1 ns [TSCTRLSSR bit is set in [Timestamp control Register \(ETH_MACTSCR\)](#)]. When TSCTRLSSR is cleared, the Nanoseconds register has a resolution of ~0.465 ns. In this case, you should program a value of 43 (0x2B) which is derived by $20 \text{ ns} / 0.465$.

Bits 15:0 Reserved, must be kept at reset value.

System time seconds register (ETH_MACSTSR)

Address offset: 0x0B08

Reset value: 0x0000 0000

The System Time Seconds register, along with System Time Nanoseconds register, indicates the current value of the system time maintained by the MAC. Though it is updated on a continuous basis, there is some delay from the actual time because of clock domain transfer latencies (from clk_ptp_ref_i to CSR clock).

Bits 31:0 **TSS[31:0]**: Timestamp Second

The value in this field indicates the current value in seconds of the System Time maintained by the MAC.

System time nanoseconds register (ETH_MACSTNR)

Address offset: 0x0B0C

Reset value: 0x0000 0000

The System Time Nanoseconds register, along with System Time Seconds register, indicates the current value of the system time maintained by the MAC.

Bit 31 Reserved, must be kept at reset value.

Bits 30:0 **TSSS[30:0]**: Timestamp subseconds

The value in this field has the subsecond representation of time, with an accuracy of 0.46 ns. When TSCTRLSSR is set in *Timestamp control Register (ETH_MACTSCR)*, each bit represents 1 ns. The maximum value is 0x3B9A_C9FF after which it rolls-over to zero.

System time seconds update register (ETH_MACSTSUR)

Address offset: 0x0B10

Reset value: 0x0000 0000

The System Time Seconds Update register, along with the System Time Nanoseconds update register, initializes or updates the system time maintained by the MAC. You must write both registers before setting the TSINIT or TSUPDT bits in *Timestamp control Register (ETH_MACTSCR)*.

| | | | | | | | | | | | | | | | |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| TSS[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **TSS[31:0]**: Timestamp Seconds

The value in this field is the seconds part of the update.
 When ADDSUB is reset, this field must be programmed with the seconds part of the update value.
 When ADDSUB is set, this field must be programmed with the complement of the seconds part of the update value.
 For example, to subtract 2.000000001 seconds from the system time, the TSS field in the ETH_MACSTSUR register must be 0xFFFF_FFFE (that is, $2^{32} - 2$).

Caution: When the ADDSUB bit is set, TSS[30:0] field cannot be set to 0 in *System time nanoseconds update register (ETH_MACSTNUR)*. The TSS bitfield must be programmed to 0x7FFF_FFFF (resulting in -0.46 ns) even if 0 ns must be subtracted.
 For example, to subtract 2.000000000 seconds from the system time, the TSS field in the *System time seconds update register (ETH_MACSTSUR)* must be 0xFFFF_FFFE (that is, $2^{32} - 1$) and the *System time nanoseconds update register (ETH_MACSTNUR)* must be 0xFFFF_FFFF (ADDSUB = 1 and TSS[30:0] field = 0x7FFF_FFFF)

System time nanoseconds update register (ETH_MACSTNUR)

Address offset: 0x0B14

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------------|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| ADD SUB | TSS[30:16] | | | | | | | | | | | | | | |
| | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| TSS[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bit 31 **ADDSUB**: Add or Subtract Time

When this bit is set, the time value is subtracted with the contents of the update register.
 When this bit is reset, the time value is added with the contents of the update register.

Bits 30:0 **TSSS[30:0]**: Timestamp subseconds

The value in this field is the subseconds part of the update.

- ADDSUB is 1: This field must be programmed with the complement of the subseconds part of the update value as described.
- ADDSUB is 0: This field must be programmed with the subseconds part of the update value, with an accuracy based on the TSCTRLSSR bit of the *Timestamp control Register (ETH_MACTSCR)*.
- TSCTRLSSR field in the *Timestamp control Register (ETH_MACTSCR)* is 1:
 - The programmed value must be $10^9 - \text{<subsecond value>}$.
 - Each bit represents 1 ns and the programmed value should not exceed 0x3B9A_C9FF.
- TSCTRLSSR field in the *Timestamp control Register (ETH_MACTSCR)* is 0:
 - The programmed value must be $2^{31} - \text{<subsecond_value>}$.
 - Each bit represents an accuracy of 0.46 ns.

For example, to subtract 2.000000001 seconds from the system time, then the TSSS field in the ETH_MACSTNUR register must be 0x7FFF_FFFF (that is, $2^{31} - 1$), when TSCTRLSSR bit in *Timestamp control Register (ETH_MACTSCR)* is reset and 0x3B9A_C9FF (that is, $10^9 - 1$), when TSCTRLSSR bit in *Timestamp control Register (ETH_MACTSCR)* is set.

Caution: When the ADDSUB bit is set, TSSS[30:0] field cannot be set to 0. The TSSS bitfield must be programmed to 0x7FFF FFFF (resulting in -0.46 ns) even if 0 ns must be subtracted.

For example, to subtract 2.000000000 seconds from the system time, *System time nanoseconds update register (ETH_MACSTNUR)* must be 0xFFFF FFFF (ADDSUB = 1 and TSSS[30:0] = 0) and the TSS field in the *System time seconds update register (ETH_MACSTSUR)* must be 0xFFFF FFFE (that is, $2^{32} - 1$).

Timestamp addend register (ETH_MACTSAR)

Address offset: 0x0B18

Reset value: 0x0000 0000

This register value is used only when the system time is configured for Fine Update mode (TSCFUPDT bit in the *Timestamp control Register (ETH_MACTSCR)*). The content of this register is added to a 32-bit accumulator in every clock cycle of clk_ptp_ref_i and the system time is updated whenever the accumulator overflows.

| | | | | | | | | | | | | | | | |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bits 31:0 **TSAR[31:0]**: Timestamp Addend Register

This field indicates the 32-bit time value to be added to the Accumulator register to achieve time synchronization.

Timestamp status register (ETH_MACTSSR)

Address offset: 0x0B20

Reset value: 0x0000 0000

All bits except Bits[27:25] gets cleared when the application reads this register.

| | | | | | | | | | | | | | | | |
|-------------|------|------------|------|------|------|------------|------|------|------|------|-------------|----------------|---------------|--------------|------------|

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:25 **ATSNS[4:0]**: Number of Auxiliary Timestamp Snapshots

This field indicates the number of Snapshots available in the FIFO. A value equal to the depth of FIFO (4) indicates that the Auxiliary Snapshot FIFO is full. These bits are cleared (to 00000) when the Auxiliary snapshot FIFO clear bit is set.

Bit 24 **ATSSTM**: Auxiliary Timestamp Snapshot Trigger Missed

This bit is set when the Auxiliary timestamp snapshot FIFO is full and external trigger was set. This indicates that the latest snapshot is not stored in the FIFO.

Bits 23:20 Reserved, must be kept at reset value.

Bits 19:16 **ATSSTN[3:0]**: Auxiliary Timestamp Snapshot Trigger Identifier

These bits identify the Auxiliary trigger inputs for which the timestamp available in the Auxiliary Snapshot Register is applicable. When more than one bit is set at the same time, it means that corresponding auxiliary triggers were sampled at the same clock. These bits are applicable only if the number of Auxiliary snapshots is more than one. One bit is assigned for each trigger as shown in the following list:

- Bit 16: Auxiliary trigger 0
- Bit 17: Auxiliary trigger 1
- Bit 18: Auxiliary trigger 2
- Bit 19: Auxiliary trigger 3

The software can read this register to find the triggers that are set when the timestamp is taken.

Bit 15 **TXTSSIS**: Tx Timestamp Status Interrupt Status

When drop transmit status is enabled in MTL, this bit is set when the captured transmit timestamp is updated in the *Tx timestamp status nanoseconds register (ETH_MACTXTSSNR)* and *Tx timestamp status seconds register (ETH_MACTXTSSSR)*.

When PTP offload feature is enabled, this bit is set when the captured transmit timestamp is updated in the *Tx timestamp status nanoseconds register (ETH_MACTXTSSNR)* and *Tx timestamp status seconds register (ETH_MACTXTSSSR)*, for PTO generated Delay Request and Pdelay request packets.

This bit is cleared when the *Tx timestamp status seconds register (ETH_MACTXTSSSR)* is read (or written to 1 when RCWE bit in *CSR software control register (ETH_MACCSRSWCR)* is set).

Bits 14:4 Reserved, must be kept at reset value.

- Bit 3 **TSTRGTERR0**: Timestamp Target Time Error
 This bit is set when the latest target time programmed in the ETH_MACPPSTTSR and ETH_MACPPSTTSNR elapses (see [PPS target time seconds register \(ETH_MACPPSTTSR\)](#) and [PPS target time nanoseconds register \(ETH_MACPPSTTNR\)](#)). This bit is cleared when the application reads this bit (or writes it to 1 when RCWE bit in [CSR software control register \(ETH_MACCSRSWCR\)](#) is set).
- Bit 2 **AUXSTRIG**: Auxiliary Timestamp Trigger Snapshot
 This bit is set high when the auxiliary snapshot is written to the FIFO. This bit is cleared when the application reads this bit (or writes it to 1 when RCWE bit in [CSR software control register \(ETH_MACCSRSWCR\)](#) is set).
- Bit 1 **TSTARGET0**: Timestamp Target Time Reached
 When set, this bit indicates that the value of system time is greater than or equal to the value specified in the ETH_MACPPSTTSR and ETH_MACPPSTTSNR registers (see [PPS target time seconds register \(ETH_MACPPSTTSR\)](#) and [PPS target time nanoseconds register \(ETH_MACPPSTTNR\)](#)). This bit is cleared when the application reads this bit (or writes of 1 when RCWE bit in [CSR software control register \(ETH_MACCSRSWCR\)](#) is set).
- Bit 0 **TSSOVF**: Timestamp Seconds Overflow
 When this bit is set, it indicates that the seconds value of the timestamp (when supporting version 2 format) has overflowed beyond 32'hFFFF_FFFF. This bit is cleared when the application reads this bit (or writes it to 1 when RCWE bit in [CSR software control register \(ETH_MACCSRSWCR\)](#) is set).

Tx timestamp status nanoseconds register (ETH_MACTXTSSNR)

Address offset: 0x0B30

Reset value: 0x0000 0000

This register contains the nanosecond part of timestamp captured for Transmit packets when Tx status is disabled.

| | | | | | | | | | | | | | | | | |

- Bit 31 **TXTSSMIS**: Transmit Timestamp Status Missed
 When this bit is set, it indicates one of the following:
 - The timestamp of the current packet is ignored if TXTSSTSM bit of the [Timestamp control Register \(ETH_MACTSCR\)](#) is reset
 - The timestamp of the previous packet is overwritten with timestamp of the current packet if TXTSSTSM bit of the [Timestamp control Register \(ETH_MACTSCR\)](#) is set.

Bits 30:0 **TXTSSLO[30:0]**: Transmit Timestamp Status Low
 This field contains the 31 bits of the Nanoseconds field of the Transmit packet's captured timestamp.

Tx timestamp status seconds register (ETH_MACTXTSSSR)

Address offset: 0x0B34

Reset value: 0x0000 0000

The register contains the higher 32 bits of the timestamp (in seconds) captured when a PTP packet is transmitted.

| | | | | | | | | | | | | | | | |

Bits 31:0 **TXTSSHI[31:0]**: Transmit Timestamp Status High

This field contains the lower 32 bits of the Seconds field of Transmit packet's captured timestamp.

Auxiliary control register (ETH_MACACR)

Address offset: 0x0B40

Reset value: 0x0000 0000

The Auxiliary Timestamp Control register controls the Auxiliary Timestamp snapshot.

| | | | | | | | | r/w | r/w | r/w | r/w | | | | r/w |

Bits 31:8 Reserved, must be kept at reset value.

Bit 7 **ATSEN3**: Auxiliary Snapshot 3 Enable

- This bit controls the capturing of Auxiliary Snapshot Trigger 3. When this bit is set, the auxiliary snapshot of the event on eth_ptp_trg3 input is enabled. When this bit is reset, the events on this input are ignored.

Bit 6 **ATSEN2**: Auxiliary Snapshot 2 Enable

- This bit controls the capturing of Auxiliary Snapshot Trigger 2. When this bit is set, the auxiliary snapshot of the event on eth_ptp_trg2 input is enabled. When this bit is reset, the events on this input are ignored.

Bit 5 **ATSEN1**: Auxiliary Snapshot 1 Enable

- This bit controls the capturing of Auxiliary Snapshot Trigger 1. When this bit is set, the auxiliary snapshot of the event on eth_ptp_trg1 input is enabled. When this bit is reset, the events on this input are ignored.

Bit 4 **ATSEN0**: Auxiliary Snapshot 0 Enable

This bit controls the capturing of Auxiliary Snapshot Trigger 0. When this bit is set, the auxiliary snapshot of the event on eth_ptp_trg0 input is enabled. When this bit is reset, the events on this input are ignored.

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **ATSFC**: Auxiliary Snapshot FIFO Clear

When set, this bit resets the pointers of the Auxiliary Snapshot FIFO. This bit is cleared when the pointers are reset and the FIFO is empty. When this bit is high, the auxiliary snapshots are stored in the FIFO.

Auxiliary timestamp nanoseconds register (ETH_MACATSNR)

Address offset: 0x0B48

Reset value: 0x0000 0000

The *Auxiliary timestamp nanoseconds register (ETH_MACATSNR)*, along with *Auxiliary timestamp seconds register (ETH_MACATSSR)*, gives the 64-bit timestamp stored as auxiliary snapshot. These two registers form the read port of a 64-bit wide FIFO with a depth of 4 words.

You can store multiple snapshots in this FIFO. Bits[29:25] in *Timestamp status register (ETH_MACTSSR)* indicate the fill-level of the FIFO. The top of the FIFO is removed only when *Auxiliary timestamp seconds register (ETH_MACATSSR)* is read.

Bit 31 Reserved, must be kept at reset value.

Bits 30:0 **AUXTSLO[30:0]**: Auxiliary Timestamp

Contains the lower 31 bits (nanoseconds field) of the auxiliary timestamp.

Auxiliary timestamp seconds register (ETH_MACATSSR)

Address offset: 0x0B4C

Reset value: 0x0000 0000

The Auxiliary Timestamp Seconds register contains the lower 32 bits of the Seconds field of the auxiliary timestamp register.

| | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bits 31:0 **AUXTSHI[31:0]**: Auxiliary Timestamp

Contains the lower 32 bits of the Seconds field of the auxiliary timestamp.

Timestamp Ingress asymmetric correction register (ETH_MACTSIACR)

Address offset: 0x0B50

Reset value: 0x0000 0000

The MAC Timestamp Ingress Asymmetry Correction register contains the Ingress Asymmetry Correction value to be used while updating correction field in PDelay_Resp PTP messages.

| | | | | | | | | | | | | | | | |
|---------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **OSTIAC[31:0]**: One-Step Timestamp Ingress Asymmetry Correction

This field contains the ingress path asymmetry value to be added to correctionField of Pdelay_Resp PTP packet. The programmed value should be in units of nanoseconds and multiplied by 2¹⁶. For example, 2.5 ns is represented as 0x00028000.

The value can also be negative, which is represented in 2's complement form with bit 31 representing the sign bit.

Timestamp Egress asymmetric correction register (ETH_MACTSEACR)

Address offset: 0x0B54

Reset value: 0x0000 0000

The MAC Timestamp Egress Asymmetry Correction register contains the Egress Asymmetry Correction value to be used while updating the correction field in PDelay_Req PTP messages.

| | | | | | | | | | | | | | | | |
|---------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **OSTEAC[31:0]**: One-Step Timestamp Egress Asymmetry Correction

This field contains the egress path asymmetry value to be subtracted from correctionField of Pdelay_Resp PTP packet. The programmed value must be the negated value in units of nanoseconds multiplied by 2¹⁶.

For example, if the required correction is +2.5 ns, the programmed value must be 0xFFFFD_8000, which is the 2's complement of 0x0002_8000(2.5 * 2¹⁶). Similarly, if the required correction is -3.3 ns, the programmed value is 0x0003_4CCC (3.3 * 2¹⁶).

Timestamp Ingress correction nanosecond register (ETH_MACTSICNR)

Address offset: 0x0B58

Reset value: 0x0000 0000

This register contains the correction value in nanoseconds to be used with the captured timestamp value in the ingress path.

| | | | | | | | | | | | | | | | |

Bits 31:0 **TSIC[31:0]**: Timestamp Ingress Correction

This field contains the ingress path correction value as defined by the Ingress Correction expression.

Timestamp Egress correction nanosecond register (ETH_MACTSECNR)

Address offset: 0x0B5C

Reset value: 0x0000 0000

This register contains the correction value in nanoseconds to be used with the captured timestamp value in the egress path.

| | | | | | | | | | | | | | | | |

Bits 31:0 **TSEC[31:0]**: Timestamp Egress Correction

This field contains the nanoseconds part of the egress path correction value as defined by the Egress Correction expression.

PPS control register (ETH_MACPPSCR)

Address offset: 0x0B70

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|------|------|----------------------|------------|--------------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | TRGTMODSELO [1:0] | PPSEN 0 | PPSCTRL[3:0] | | | |
| | | | | | | | | | | r w | r w | r w | r w | r w | r w |

Bits 31:7 Reserved, must be kept at reset value.

Bits 6:5 **TRGTMODSEL0[1:0]**: Target Time Register Mode for PPS Output

This field indicates the Target Time registers (*PPS target time seconds register (ETH_MACPPSTTSR)* and *PPS target time nanoseconds register (ETH_MACPPSTTNR)*) mode for PPS output signal:

00: Target Time registers are programmed only for generating the interrupt event.

01: Reserved, must not be used

10: Target Time registers are programmed for generating the interrupt event and starting or stopping the PPS output signal generation.

11: Target Time registers are programmed only for starting or stopping the PPS output signal generation. No interrupt is asserted.

Bit 4 **PPSENO**: Flexible PPS Output Mode Enable

When this bit is set, PPSCCTRL[3:0] function as PPSCMD[3:0]. When this bit is reset, PPSCCTRL[3:0] function as PPSCCTRL (Fixed PPS mode).

Bits 3:0 **PPSCTRL[3:0]**: PPS Output Frequency Control

This field controls the frequency of the PPS output (*eth_ptp_pps_out*) signal. The default value of PPSCTRL is 0000, and the PPS output is 1 pulse (of width *clk_ptp_i*) every second. For other values of PPSCTRL, the PPS output becomes a generated clock of following frequencies:

0001: The binary rollover is 2 Hz, and the digital rollover is 1 Hz.

0010: The binary rollover is 4 Hz, and the digital rollover is 2 Hz.

0011: The binary rollover is 8 Hz, and the digital rollover is 4 Hz.

0100: The binary rollover is 16 Hz, and the digital rollover is 8 Hz.

..

1111: The binary rollover is 32.768 KHz and the digital rollover is 16.384 KHz.

Note: In the binary rollover mode, the PPS output (eth_ptp_pps_out) has a duty cycle of 50 percent with these frequencies. In the digital rollover mode, the PPS output frequency is an average number. The actual clock is of different frequency that gets synchronized every second. For example:

- *When PPSCTRL = 0001, the PPS (1 Hz) has a low period of 537 ms and a high period of 463 ms*
- *When PPSCTRL = 0010, the PPS (2 Hz) is a sequence of One clock of 50 percent duty cycle and 537 ms period
Second clock of 463 ms period (268 ms low and 195 ms high)*
- *When PPSCTRL = 0011, the PPS (4 Hz) is a sequence of Three clocks of 50 percent duty cycle and 268 ms period
Fourth clock of 195 ms period (134 ms low and 61 ms high)*

This behavior is because of the non-linear toggling of bits in the digital rollover mode in the ETH_MACSTNR register.

PPS control register [alternate] (ETH_MACPPSCR)

Address offset: 0x0B70

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|------|----------------------|------|------------|-------------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | TRGTMODSEL0 [1:0] | | PPSEN 0 | PPSCMD[3:0] | | | |
| | | | | | | | | | rw | rw | rw | rw | rw | rw | rw |

Bits 31:7 Reserved, must be kept at reset value.

Bits 6:5 **TRGTMODSEL0[1:0]**: Target Time Register Mode for PPS Output

This field indicates the Target Time registers (*PPS target time seconds register (ETH_MACPPSTTSR)* and *PPS target time nanoseconds register (ETH_MACPPSTTNR)*) mode for PPS output signal:

00: Target Time registers are programmed only for generating the interrupt event.

01: Reserved, must not be used

10: Target Time registers are programmed for generating the interrupt event and starting or stopping the PPS output signal generation.

11: Target Time registers are programmed only for starting or stopping the PPS output signal generation. No interrupt is asserted.

Bit 4 **PPSEN0**: Flexible PPS Output Mode Enable

When this bit is set, Bits[3:0] function as PPSCMD[3:0]. When this bit is reset, Bits[3:0] function as PPSCTRL(Fixed PPS mode).

Bits 3:0 **PPSCMD[3:0]**: Flexible PPS Output (eth_ptp_pps_out) Control

Programming these bits with a non-zero value instructs the MAC to initiate an event. When the command is transferred or synchronized to the PTP clock domain, these bits get cleared automatically. The software should ensure that these bits are programmed only when they are 'all zero'. The following list describes the values of PPSCMD0:

0000: No Command

0001: START Single Pulse.

This command generates single pulse rising at the start point defined in Target Time Registers (register 455 and 456) and of a duration defined in the PPS Width Register.

0010: START Pulse Train.

This command generates the train of pulses rising at the start point defined in the Target Time Registers and of a duration defined in the PPS Width Register and repeated at interval defined in the PPS Interval Register. By default, the PPS pulse train is free-running unless stopped by the 'Stop Pulse train at time' or 'Stop Pulse Train immediately' commands.

0011: Cancel START.

This command cancels the START Single Pulse and START Pulse Train commands if the system time has not crossed the programmed start time.

0100: STOP Pulse Train at time.

This command stops the train of pulses initiated by the START Pulse Train command (PPSCMD[3:0] = 0010) after the time programmed in the Target Time registers elapses.

0101: STOP Pulse Train immediately.

This command immediately stops the train of pulses initiated by the START Pulse Train command (PPSCMD[3:0] = 0010).

0110: Cancel STOP Pulse train.

This command cancels the STOP pulse train at time command if the programmed stop time has not elapsed. The PPS pulse train becomes free-running on the successful execution of this command.

0111 to 1111: Reserved, must not be used

PPS target time seconds register (ETH_MACPPSTTSR)

Address offset: 0x0B80

Reset value: 0x0000 0000

The PPS output Target Time Seconds register, along with [PPS target time nanoseconds register \(ETH_MACPPSTTNR\)](#), is used to schedule an interrupt event (Bit TSSOVF of [Timestamp status register \(ETH_MACTSSR\)](#)) when the system time exceeds the value programmed in these registers.

| | | | | | | | | | | | | | | | |
|---------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| TSTRH0[31:16] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| TSTRH0[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **TSTRH0[31:0]**: PPS Target Time Seconds Register

This field stores the time in seconds. When the timestamp value matches or exceeds both Target Timestamp registers, the MAC starts or stops the PPS signal output and generates an interrupt (if enabled) based on Target Time mode selected for the corresponding PPS output in the *PPS control register (ETH_MACPPSCR)*.

PPS target time nanoseconds register (ETH_MACPPSTNR)

Address offset: 0x0B84

Reset value: 0x0000 0000

The PPS Target Time Nanoseconds register is present only when more than one Flexible PPS output is selected.

| | | | | | | | | | | | | | | | |
|---------------|--------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| TRGTB USY0 | TTSL0[30:16] | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| TTSL0[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bit 31 **TRGTBUSY0**: PPS Target Time Register Busy

The MAC sets this bit when the PPSCMD0 field in the *PPS control register (ETH_MACPPSCR)* is programmed to 010 or 011. Programming the PPSCMD0 field to 010 or 011 instructs the MAC to synchronize the Target Time Registers to the PTP clock domain. The MAC clears this bit after synchronizing the Target Time Registers with the PTP clock domain. The application must not update the Target Time Registers when this bit is read as 1. Otherwise, the synchronization of the previous programmed time gets corrupted.

Bits 30:0 **TTSL0[30:0]**: Target Time Low for PPS Register

This register stores the time in (signed) nanoseconds. When the value of the timestamp matches the value in both Target Timestamp registers, the MAC starts or stops the PPS signal output and generates an interrupt (if enabled) based on the TRGTMODSEL0 field (Bits [6:5]) in *PPS control register (ETH_MACPPSCR)*.

When the TSCTRLSSR bit is set in the *Timestamp control Register (ETH_MACTSCR)*, this value should not exceed 0x3B9A_C9FF. The actual start or stop time of the PPS signal output may have an error margin up to one unit of subsecond increment value.

PPS interval register (ETH_MACPPSIR)

Address offset: 0x0B88

Reset value: 0x0000 0000

The PPS Interval register contains the number of units of subsecond increment value between the rising edges of PPS output.

| | | | | | | | | | | | | | | | |
|----------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| PPSINT0[31:16] | | | | | | | | | | | | | | | |
| r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w |

| PPSINT0[15:0] | | | | | | | | | | | | | | | |
| r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w |

Bits 31:0 **PPSINT0[31:0]**: PPS Output Signal Interval

These bits store the interval between the rising edges of PPS signal output. The interval is stored in terms of number of units of subsecond increment value.

You need to program one value less than the required interval. For example, if the PTP reference clock is 50 MHz (period of 20 ns), and desired interval between the rising edges of PPS signal output is 100 ns (that is, 5 units of subsecond increment value), you should program value 4 (5-1) in this register.

PPS width register (ETH_MACPPSWR)

Address offset: 0x0B8C

Reset value: 0x0000 0000

The PPS Width register contains the number of units of subsecond increment value between the rising and corresponding falling edges of PPS output.

| | | | | | | | | | | | | | | | |
|------------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| PPSWIDTH0[31:16] | | | | | | | | | | | | | | | |
| r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| PPSWIDTH0[15:0] | | | | | | | | | | | | | | | |
| r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w |

Bits 31:0 **PPSWIDTH0[31:0]**: PPS Output Signal Width

These bits store the width between the rising edge and corresponding falling edge of PPS signal output. The width is stored in terms of number of units of subsecond increment value.

You need to program one value less than the required interval. For example, if PTP reference clock is 50 MHz (period of 20 ns), and width between the rising and corresponding falling edges of PPS signal output is 80 ns (that is, four units of subsecond increment value), you should program value 3 (4-1) in this register.

Note: The value programmed in this register must be lesser than the value programmed in PPS interval register (ETH_MACPPSIR).

PTP Offload control register (ETH_MACPOCR)

Address offset: 0x0BC0

Reset value: 0x0000 0000

This register controls the PTP Offload Engine operation.

| | | | | | | | | | | | | | | | |
|---------|------|------|------|------|------|------|------|------|--------|------------|-----------|------|----------|---------|-------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| rw | rw | rw | rw | rw | rw | rw | rw | | rw | rw | rw | | rw | rw | rw |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:8 **DN[7:0]**: Domain Number

This field indicates the domain Number in which the PTP node is operating.

Bit 7 Reserved, must be kept at reset value.

Bit 6 **DRRDIS**: Disable PTO Delay Request/Response response generation

When this bit is set, the Delay Request and Delay response are not generated for received SYNC and Delay request packet respectively, as required by the programmed mode.

Bit 5 **APDREQTRIG**: Automatic PTP Pdelay_Req message Trigger

When this bit is set, one PTP Pdelay_Req message is transmitted. This bit is automatically cleared after the PTP Pdelay_Req message is transmitted. The application should set the APDREQEN bit for this operation.

Bit 4 **ASYNCTRIG**: Automatic PTP SYNC message Trigger

When this bit is set, one PTP SYNC message is transmitted. This bit is automatically cleared after the PTP SYNC message is transmitted. The application should set the ASYNCEN bit for this operation.

Bit 3 Reserved, must be kept at reset value.

Bit 2 **APDREQEN**: Automatic PTP Pdelay_Req message Enable

When this bit is set, PTP Pdelay_Req message is generated periodically based on interval programmed or trigger from application, when the MAC is programmed to be in Peer-to-Peer Transparent mode.

Bit 1 **ASYNCEN**: Automatic PTP SYNC message Enable

When this bit is set, PTP SYNC message is generated periodically based on interval programmed or trigger from application, when the MAC is programmed to be in Clock Master mode.

Bit 0 **PTOEN**: PTP Offload Enable

When this bit is set, the PTP Offload feature is enabled.

PTP Source Port Identity 0 Register (ETH_MACSPI0R)

Address offset: 0x0BC4

Reset value: 0x0000 0000

This register contains Bits[31:0] of the 80-bit Source Port Identity of the PTP node.

| | | | | | | | | | | | | | | | |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

Bits 31:0 **SPI0[31:0]**: Source Port Identity 0
 This field indicates bits [31:0] of sourcePortIdentity of PTP node.

PTP Source port identity 1 register (ETH_MACSPI1R)

Address offset: 0x0BC8

Reset value: 0x0000 0000

This register contains Bits[63:32] of the 80-bit Source Port Identity of the PTP node.

| | | | | | | | | | | | | | | | |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

Bits 31:0 **SPI1[31:0]**: Source Port Identity 1
 This field indicates bits [63:32] of sourcePortIdentity of PTP node.

PTP Source port identity 2 register (ETH_MACSPI2R)

Address offset: 0x0BCC

Reset value: 0x0000 0000

This register contains Bits[79:64] of the 80-bit Source Port Identity of the PTP node.

| | | | | | | | | | | | | | | | |

| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **SPI2[15:0]**: Source Port Identity 2
 This field indicates bits [79:64] of sourcePortIdentity of PTP node.

Log message interval register (ETH_MACLMIR)

Address offset: 0x0BD0

Reset value: 0x0000 0000

This register contains the periodic intervals for automatic PTP packet generation.

| | | | | | | | | | | | | | | | |
|-------------|------|------|------|------|--------------|----|----|----------|------|------|------|------|------|------|------|

| | | | | | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:24 **LMPDRI[7:0]**: Log Min Pdelay_Req Interval

This field indicates logMinPdelayReqInterval of PTP node. This is used to schedule the periodic Pdelay request packet transmission. Allowed values are -15 to 15. Negative value must be represented in 2's-complement form. For example, if the required value is -1, the value programmed must be 0xFF.

Bits 23:11 Reserved, must be kept at reset value.

Bits 10:8 **DRSYNCR[2:0]**:

Delay_Req to SYNC Ratio

In Slave mode, it is used for controlling frequency of Delay_Req messages transmitted.

- 0: DelayReq generated for every received SYNC
- 1: DelayReq generated every alternate reception of SYNC
- 2: for every 4 SYNC messages
- 3: for every 8 SYNC messages
- 4: for every 16 SYNC messages
- 5: for every 32 SYNC messages
- Others: Reserved, must not be used

The master sends this information (logMinDelayReqInterval) in the DelayResp PTP messages to the slave. The reception processes this value from the received DelayResp messages and updates this field accordingly. In the Slave mode, the host must not write/update this register unless it has to override the received value. In Master mode, the sum of this field and logSyncInterval (LSI) field is provided in the logMinDelayReqInterval field of the generated multicast Delay_Resp PTP message.

Bits 7:0 **LSI[7:0]**:

Log Sync Interval

This field indicates the periodicity of the automatically generated SYNC message when the PTP node is Master. Allowed values are -15 to 15. Negative value must be represented in 2's-complement form. For example, if the required value is -1, the value programmed must be 0xFF.

Ethernet MAC register map and reset values

Refer to [Section 2.3 on page 129](#) for the register boundary addresses.

59 HDMI-CEC controller (CEC)

59.1 HDMI-CEC introduction

Consumer electronics control (CEC) is part of HDMI (high-definition multimedia interface) standard. It contains a protocol that provides high-level control functions between various audiovisual products. CEC operates at low speeds, with minimum processing and memory overhead.

The HDMI-CEC controller provides hardware support for this protocol.

59.2 HDMI-CEC controller main features

- Complies with HDMI-CEC v1.4 specification
- Independent 32 kHz CEC kernel (refer to *section RCC kernel clock distribution*)
- Works in Stop mode for ultra-low-power applications
- Configurable signal-free time before start of transmission
 - Automatic by hardware, according to CEC state and transmission history
 - Fixed by software (7 timing options)
- Configurable peripheral address (OAR)
- Supports Listen mode
 - Enables reception of CEC messages sent to destination address different from OAR without interfering with the CEC line
- Configurable Rx-tolerance margin
 - Standard tolerance
 - Extended tolerance
- Receive-error detection
 - Bit rising error (BRE), with optional stop of reception (BRESTP)
 - Short bit period error (SBPE)
 - Long bit period error (LBPE)
- Configurable error-bit generation
 - on BRE detection (BREGEN)
 - on LBPE detection (LBPEGEN)
 - always generated on SBPE detection
- Transmission error detection (TXERR)
- Arbitration lost detection (ARBLST)
 - with automatic transmission retry
- Transmission underrun detection (TXUDR)
- Reception overrun detection (RXOVR)

59.3 HDMI-CEC functional description

59.3.1 HDMI-CEC pin and internal signals

The CEC bus consists of a single bidirectional line that is used to transfer data in and out of the device. It is connected to a +3.3 V supply voltage via a 27 kΩ pull-up resistor. The output stage of the device must have an open-drain or open-collector to allow a wired-AND connection.

The HDMI-CEC controller manages the CEC bidirectional line as an alternate function of a standard GPIO, assuming that it is configured as alternate function open drain. The 27 kΩ pull-up must be added externally to the microcontroller.

To not interfere with the CEC bus when the application power is removed, it is mandatory to isolate the CEC pin from the bus in such conditions. This can be done by using a MOS transistor, as shown on [Figure 817](#).

[Table 589](#) lists the internal signals that are exchanged between the HDMI-CEC and other functional blocks (such as RCC and EXTI).

Table 588. HDMI pin

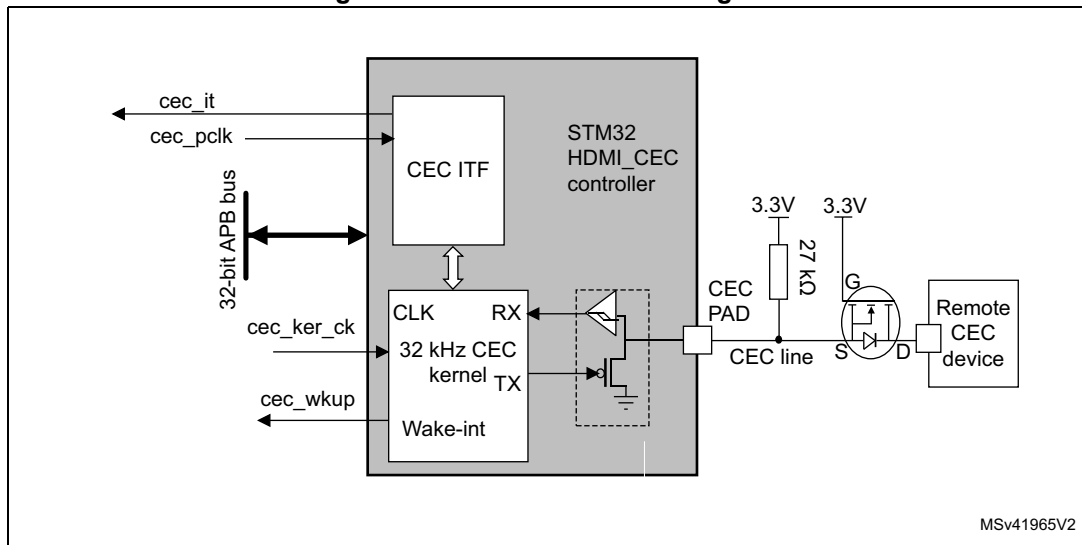

| Name | Signal type | Remarks |
|------|---------------|--|
| CEC | Bidirectional | Two states: – 1 = high impedance – 0 = low impedance A 27 kΩ resistor must be added externally. |

Table 589. HDMI-CEC internal input/output signals

| Signal name | Signal type | Description |
|-------------|----------------|---------------------------|
| cec_wkup | Digital output | HDMI-CEC wake-up signal |
| cec_it | Digital output | HDMI-CEC interrupt signal |
| cec_pclk | Digital input | APB clock |
| cec_ker_ck | Digital input | HDMI-CEC kernel clock |

59.3.2 HDMI-CEC block diagram

Figure 817. HDMI-CEC block diagram

59.3.3 Message description

All transactions on the CEC line consist of an initiator and one or more followers. The initiator is responsible for sending the message structure and the data. The follower is the recipient of any data and is responsible for setting any acknowledgment bits.

A message is conveyed in a single frame that consists of a start bit followed by a header block and optionally an opcode and a variable number of operand blocks.

All these blocks are made of a 8-bit payload - most significant bit is transmitted first - followed by an end of message (EOM) bit and an acknowledge (ACK) bit.

The EOM bit is set in the last block of a message and kept reset in all others. In case a message contains additional blocks after an EOM is indicated, those additional blocks must be ignored. The EOM bit may be set in the header block to 'ping' other devices, to make sure they are active.

The acknowledge bit is always set to high impedance by the initiator so that it can be driven low either by the follower that has read its own address in the header, or by the follower that needs to reject a broadcast message.

The header consists of the source logical address field, and the destination logical address field. Note that the special address 0xF is used for broadcast messages.

Figure 818. Message structure

Figure 819. Blocks

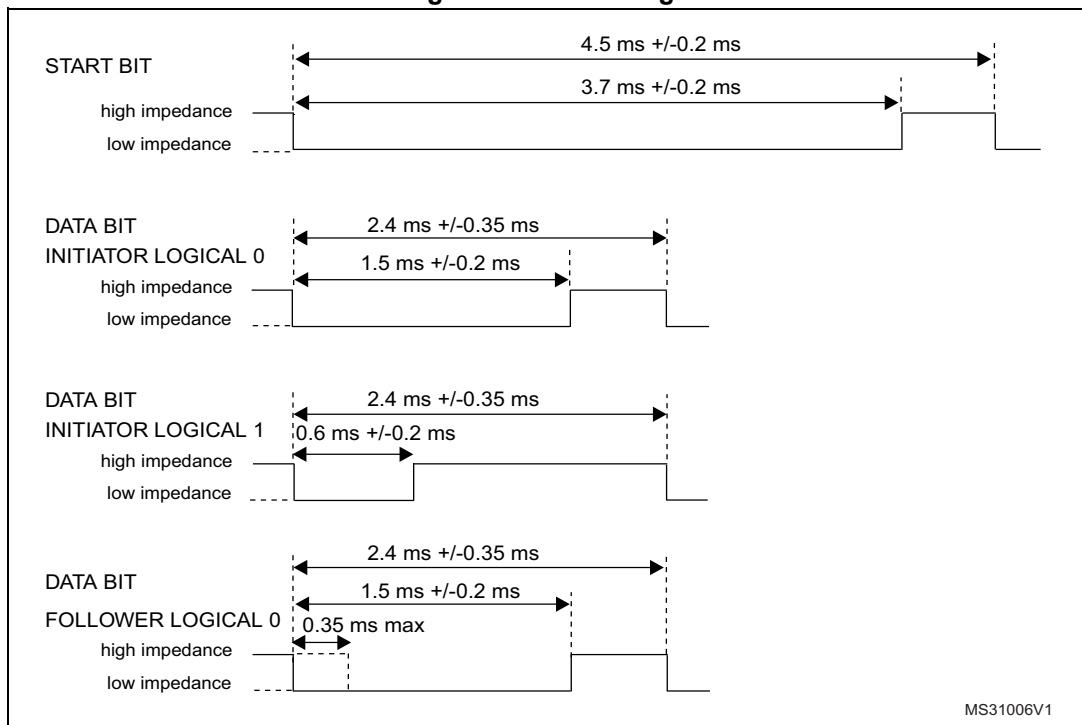

59.3.4 Bit timing

The format of the start bit is unique and identifies the start of a message. It must be validated by its low duration and its total duration.

All remaining data bits in the message, after the start bit, have consistent timing. The high-to-low transition at the end of the data bit is the start of the next data bit except for the final bit where the CEC line remains high.

Figure 820. Bit timings

59.4 Arbitration

All devices transmitting - or retransmitting - a message onto the CEC line must ensure that it has been inactive for a number of bit periods. This signal-free time is defined as the time

starting from the final bit of the previous frame and depends on the initiating device and the current status as shown in the figure below.

Figure 821. Signal free time

Since only one initiator is allowed at any one time, an arbitration mechanism is provided to avoid conflict when more than one initiator begins transmitting at the same time.

CEC line arbitration starts with the leading edge of the start bit and continues until the end of the initiator address bits within the header block. During this period, the initiator must monitor the CEC line, if whilst driving the line to high impedance it reads it back to 0. Assuming then it has lost arbitration, it stops transmitting and becomes a follower.

Figure 822. Arbitration phase

Figure 823 shows an example for a SFT of three nominal bit periods.

Figure 823. SFT of three nominal bit periods

A configurable time window is counted before starting the transmission.

In the SFT = 0 configuration, HDMI-CEC performs automatic SFT calculation ensuring compliance with the HDMI-CEC standard:

- 2.5 data bit periods if the CEC is the last bus initiator with unsuccessful transmission
- 4 data bit periods if the CEC is the new bus initiator
- 6 data bit periods if the CEC is the last bus initiator with successful transmission

This is done to guarantee the maximum priority to a failed transmission and the lowest one to the last initiator that completed successfully its transmission.

Otherwise there is the possibility to configure the SFT bits to count a fixed timing value. Possible values are 0.5, 1.5, 2.5, 3.5, 4.5, 5.5, 6.5 data bit periods.

59.4.1 SFT option bit

In case of SFTOPT = 0 configuration, SFT starts being counted when the start-of-transmission command is set by software (TXSOM = 1).

In case of SFTOPT = 1, SFT starts automatically being counted by the HDMI-CEC device when a bus-idle or line error condition is detected. If the SFT timer is completed at the time TXSOM command is set then transmission starts immediately without latency. If the SFT timer is still running instead, the system waits until the timer elapses before transmission can start.

In case of SFTOPT = 1 a bus-event condition starting the SFT timer is detected in the following cases:

- In case of a regular end of transmission/reception, when TXEND/RXEND bits are set at the minimum nominal data bit duration of the last bit in the message (ACK bit).
- In case of a transmission error detection, SFT timer starts when the TXERR transmission error is detected (TXERR = 1).
- In case of a missing acknowledge from the CEC follower, the SFT timer starts when the TXACKE bit is set, that is at the nominal sampling time of the ACK bit.
- In case of a transmission underrun error, the SFT timer starts when the TXUDR bit is set at the end of the ACK bit.
- In case of a receive error detection implying reception abort, the SFT timer starts at the same time the error is detected. If an error bit is generated, then SFT starts being counted at the end of the error bit.
- In case of a wrong start bit or of any uncodified low impedance bus state from idle, the SFT timer is restarted as soon as the bus comes back to hi-impedance idleness.

59.5 Error handling

59.5.1 Bit error

If a data bit - excluding the start bit - is considered invalid, the follower is expected to notify such error by generating a low bit period on the CEC line of 1.4 to 1.6 times the nominal data bit period (3.6 ms nominally).

Figure 824. Error bit timing

59.5.2 Message error

A message is considered lost and therefore may be retransmitted under the following conditions:

- a message is not acknowledged in a directly addressed message
- a message is negatively acknowledged in a broadcast message
- a low impedance is detected on the CEC line while it is not expected (line error)

Three kinds of error flag can be detected when the CEC interface is receiving a data bit:

59.5.3 Bit rising error (BRE)

BRE (bit rising error) is set when a bit rising edge is detected outside the windows where it is expected (see [Figure 825](#)). BRE flag also generates a CEC interrupt if the BREIE = 1.

In the case of a BRE detection, the message reception can be stopped according to the BRESTP bit value and an error bit can be generated if BREGEN bit is set.

When BRE is detected in a broadcast message with BRESTP = 1 an error bit is generated even if BREGEN = 0 to enforce initiator's retry of the failed transmission. Error bit generation can be disabled by configuring BREGEN = 0, BRDNOGEN = 1.

59.5.4 Short bit period error (SBPE)

SBPE is set when a bit falling edge is detected earlier than expected (see [Figure 825](#)). SBPE flag also generates a CEC interrupt if the SBPEIE = 1.

An error bit is always generated on the line in case of a SBPE error detection. An error bit is not generated upon SBPE detection only when Listen mode is set (LSTN = 1) and the following conditions are met:

- A directly addressed message is received containing SBPE
- A broadcast message is received containing SBPE AND BRDNOGEN = 1

59.5.5 Long bit period error (LBPE)

LBPE is set when a bit falling edge is not detected in a valid window (see [Figure 825](#)). LBPE flag also generates a CEC interrupt if the LBPEIE = 1.

LBPE always stops the reception, an error bit is generated on the line when LBPEGEN bit is set.

When LBPE is detected in a broadcast message an error bit is generated even if LBPEGEN = 0 to enforce initiator's retry of the failed transmission. Error bit generation can be disabled by configuring LBPEGEN = 0, BRDNOGEN = 1.

Note: The BREGEN = 1, BRESTP = 0 configuration must be avoided.

Figure 825. Error handling

MS31011V1

Table 590. Error handling timing parameters

| Time | RXTOL | ms | Description |
|----------|-------|------|---|
| T_s | x | 0 | Bit start event. |
| T_1 | 1 | 0.3 | The earliest time for a low - high transition when indicating a logical 1. |
| | 0 | 0.4 | |
| T_{n1} | x | 0.6 | The nominal time for a low - high transition when indicating a logical 1. |
| T_2 | 0 | 0.8 | The latest time for a low - high transition when indicating a logical 1. |
| | 1 | 0.9 | |
| T_{ns} | x | 1.05 | Nominal sampling time. |
| T_3 | 1 | 1.2 | The earliest time a device is permitted return to a high impedance state (logical 0). |
| | 0 | 1.3 | |
| T_{n0} | x | 1.5 | The nominal time a device is permitted return to a high impedance state (logical 0). |
| T_4 | 0 | 1.7 | The latest time a device is permitted return to a high impedance state (logical 0). |
| | 1 | 1.8 | |
| T_5 | 1 | 1.85 | The earliest time for the start of a following bit. |
| | 0 | 2.05 | |
| T_{nf} | x | 2.4 | The nominal data bit period. |
| T_6 | 0 | 2.75 | The latest time for the start of a following bit. |
| | 1 | 2.95 | |

59.5.6 Transmission error detection (TXERR)

The CEC initiator sets the TXERR flag if detecting low impedance on the CEC line when it is transmitting high impedance and is not expecting a follower asserted bit. TXERR flag also generates a CEC interrupt if the TXERRIE = 1.

TXERR assertion stops the message transmission. Application is in charge to retry the failed transmission up to five times.

TXERR checks are performed differently depending on the different states of the CEC line and on the RX tolerance configuration.

Figure 826. TXERR detection

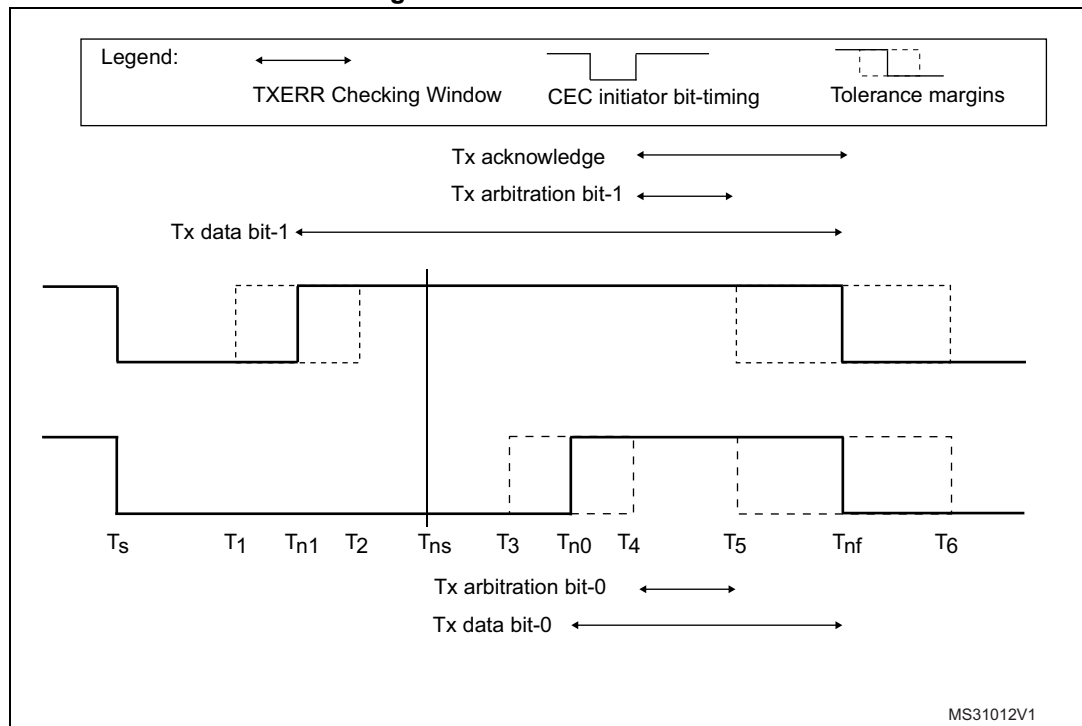

Table 591. TXERR timing parameters

| Time | RXTOL | ms | Description |
|----------|-------|------|---|
| T_s | x | 0 | Bit start event. |
| T_1 | 1 | 0.3 | The earliest time for a low - high transition when indicating a logical 1. |
| | 0 | 0.4 | |
| T_{n1} | x | 0.6 | The nominal time for a low - high transition when indicating a logical 1. |
| T_2 | 0 | 0.8 | The latest time for a low - high transition when indicating a logical 1. |
| | 1 | 0.9 | |
| T_{ns} | x | 1.05 | Nominal sampling time. |
| T_3 | 1 | 1.2 | The earliest time a device is permitted return to a high impedance state (logical 0). |
| | 0 | 1.3 | |

Table 591. TXERR timing parameters (continued)

| Time | RXTOL | ms | Description |
|----------|-------|------|--|
| T_{n0} | x | 1.5 | The nominal time a device is permitted return to a high impedance state (logical 0). |
| T_4 | 0 | 1.7 | The latest time a device is permitted return to a high impedance state (logical 0). |
| | 1 | 1.8 | |
| T_5 | 1 | 1.85 | The earliest time for the start of a following bit. |
| | 0 | 2.05 | |
| T_{nf} | x | 2.4 | The nominal data bit period. |
| T_6 | 0 | 2.75 | The latest time for the start of a following bit. |
| | 1 | 2.95 | |

59.6 HDMI-CEC interrupts

An interrupt can be produced:

- during reception if a receive block transfer is finished or if a receive error occurs.
- during transmission if a transmit block transfer is finished or if a transmit error occurs.

Table 592. HDMI-CEC interrupts

| Interrupt event | Event flag | Enable control bit |
|------------------------------|------------|--------------------|
| Rx-byte received | RXBR | RXBRIE |
| End of reception | RXEND | RXENDIE |
| Rx-overflow | RXOVR | RXOVRIE |
| Rxbit rising error | BRE | BREIE |
| Rx-short bit period error | SBPE | SBPEIE |
| Rx-long bit period error | LBPE | LBPEIE |
| Rx-missing acknowledge error | RXACKE | RXACKEIE |
| Arbitration lost | ARBLST | ARBLSTIE |
| Tx-byte request | TXBR | TXBRIE |
| End of transmission | TXEND | TXENDIE |
| Tx-buffer underrun | TXUDR | TXUDRIE |
| Tx-error | TXERR | TXERRIE |
| Tx-missing acknowledge error | TXACKE | TXACKEIE |

59.7 HDMI-CEC registers

Refer to [Section 1.2](#) for a list of abbreviations used in register descriptions. The registers have to be accessed by words (32 bits).

59.7.1 CEC control register (CEC_CR)

Address offset: 0x00

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|------|------|------|------|------|-------|-------|-------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | TXEOM | TXSOM | CECEN |
| | | | | | | | | | | | | | rs | rs | rw |

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 TXEOM: Tx end of message

The TXEOM bit is set by software to command transmission of the last byte of a CEC message.

TXEOM is cleared by hardware at the same time and under the same conditions as for TXSOM.

0: TXDR data byte is transmitted with EOM = 0.

1: TXDR data byte is transmitted with EOM = 1.

Note: TXEOM must be set when CECEN = 1.

TXEOM must be set before writing transmission data to TXDR.

If TXEOM is set when TXSOM = 0, transmitted message consists of 1 byte (HEADER) only (PING message).

Bit 1 TXSOM: Tx start of message

TXSOM is set by software to command transmission of the first byte of a CEC message. If the CEC message consists of only one byte, TXEOM must be set before of TXSOM.

Start-bit is effectively started on the CEC line after SFT is counted. If TXSOM is set while a message reception is ongoing, transmission starts after the end of reception.

TXSOM is cleared by hardware after the last byte of the message is sent with a positive acknowledge (TXEND = 1), in case of transmission underrun (TXUDR = 1), negative acknowledge (TXACKE = 1), and transmission error (TXERR = 1). It is also cleared by CECEN = 0. It is not cleared and transmission is automatically retried in case of arbitration lost (ARBLST = 1).

TXSOM can be also used as a status bit informing application whether any transmission request is pending or under execution. The application can abort a transmission request at any time by clearing the CECEN bit.

0: No CEC transmission is on-going.

1: CEC transmission command

Note: TXSOM must be set when CECEN = 1.

TXSOM must be set when transmission data is available into TXDR.

HEADER first four bits containing own peripheral address are taken from TXDR[7:4], not from CEC_CFGR.OAR that is used only for reception.

Bit 0 **CECEN**: CEC enable

The CECEN bit is set and cleared by software. CECEN = 1 starts message reception and enables the TXSOM control. CECEN = 0 disables the CEC peripheral, clears all bits of CEC_CR register and aborts any on-going reception or transmission.

- 0: CEC peripheral is off.
- 1: CEC peripheral is on.

59.7.2 CEC configuration register (CEC_CFGR)

This register is used to configure the HDMI-CEC controller.

Address offset: 0x04

Reset value: 0x0000 0000

Caution: It is mandatory to write CEC_CFGR only when CECEN = 0.

| | | | | | | | | | | | | | | | |

| Res. | Res. | Res. | Res. | Res. | Res. | Res. | SFTOP | BRDN OGEN | LBPEG EN | BREGE N | BREST P | RXTOL | SFT[2:0] | | |
| | | | | | | | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w |

Bit 31 **LSTN**: Listen mode

LSTN bit is set and cleared by software.

0: CEC peripheral receives only message addressed to its own address (OAR). Messages addressed to different destination are ignored. Broadcast messages are always received.

1: CEC peripheral receives messages addressed to its own address (OAR) with positive acknowledge. Messages addressed to different destination are received, but without interfering with the CEC bus: no acknowledge sent.

Bits 30:16 **OAR[14:0]**: Own addresses configuration

The OAR bits are set by software to select which destination logical addresses has to be considered in receive mode. Each bit, when set, enables the CEC logical address identified by the given bit position.

At the end of HEADER reception, the received destination address is compared with the enabled addresses. In case of matching address, the incoming message is acknowledged and received. In case of non-matching address, the incoming message is received only in listen mode (LSTN = 1), but without acknowledge sent. Broadcast messages are always received.

Example:

OAR = 0b000 0000 0010 0001 means that CEC acknowledges addresses 0x0 and 0x5. Consequently, each message directed to one of these addresses is received.

Bits 15:9 Reserved, must be kept at reset value.

Bit 8 **SFTOP**: SFT option bit

The SFTOPT bit is set and cleared by software.

0: SFT timer starts when TXSOM is set by software.

1: SFT timer starts automatically at the end of message transmission/reception.

- Bit 7 BRDNOGEN:** Avoid error-bit generation in broadcast
 The BRDNOGEN bit is set and cleared by software.
 0: BRE detection with BRESTP = 1 and BREGEN = 0 on a broadcast message generates an error-bit on the CEC line. LBPE detection with LBPEGEN = 0 on a broadcast message generates an error-bit on the CEC line.
 1: Error-bit is not generated in the same condition as above. An error-bit is not generated even in case of an SBPE detection in a broadcast message if listen mode is set.
- Bit 6 LBPEGEN:** Generate error-bit on long bit period error
 The LBPEGEN bit is set and cleared by software.
 0: LBPE detection does not generate an error-bit on the CEC line.
 1: LBPE detection generates an error-bit on the CEC line.
Note: If BRDNOGEN = 0, an error-bit is generated upon LBPE detection in broadcast even if LBPEGEN = 0.
- Bit 5 BREGEN:** Generate error-bit on bit rising error
 The BREGEN bit is set and cleared by software.
 0: BRE detection does not generate an error-bit on the CEC line.
 1: BRE detection generates an error-bit on the CEC line (if BRESTP is set).
Note: If BRDNOGEN = 0, an error-bit is generated upon BRE detection with BRESTP = 1 in broadcast even if BREGEN = 0.
- Bit 4 BRESTP:** Rx-stop on bit rising error
 The BRESTP bit is set and cleared by software.
 0: BRE detection does not stop reception of the CEC message. Data bit is sampled at 1.05 ms.
 1: BRE detection stops message reception.
- Bit 3 RXTOL:** Rx-tolerance
 The RXTOL bit is set and cleared by software.
 0: Standard tolerance margin:
 – Start-bit, +/- 200 μ s rise, +/- 200 μ s fall
 – Data-bit: +/- 200 μ s rise. +/- 350 μ s fall
 1: Extended tolerance
 – Start-bit: +/- 400 μ s rise, +/- 400 μ s fall
 – Data-bit: +/-300 μ s rise, +/- 500 μ s fall
- Bits 2:0 SFT[2:0]:** Signal free time
 SFT bits are set by software. In the SFT = 0x0 configuration, the number of nominal data bit periods waited before transmission is ruled by hardware according to the transmission history. In all the other configurations the SFT number is determined by software.
 0x0
 – 2.5 data-bit periods if CEC is the last bus initiator with unsuccessful transmission (ARBLST = 1, TXERR = 1, TXUDR = 1 or TXACKE = 1)
 – 4 data-bit periods if CEC is the new bus initiator
 – 6 data-bit periods if CEC is the last bus initiator with successful transmission (TXEOM = 1)
 0x1: 0.5 nominal data bit periods
 0x2: 1.5 nominal data bit periods
 0x3: 2.5 nominal data bit periods
 0x4: 3.5 nominal data bit periods
 0x5: 4.5 nominal data bit periods
 0x6: 5.5 nominal data bit periods
 0x7: 6.5 nominal data bit periods

59.7.3 CEC Tx data register (CEC_TXDR)

Address offset: 0x8

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|----------|------|------|------|------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |

| | | | | | | | | w | w | w | w | w | w | w | w |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **TXD[7:0]**: Tx data

TXD is a write-only register containing the data byte to be transmitted.

59.7.4 CEC Rx data register (CEC_RXDR)

Address offset: 0xC

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|----------|------|------|------|------|------|------|------|

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **RXD[7:0]**: Rx data

RXD is read-only and contains the last data byte that has been received from the CEC line.

59.7.5 CEC interrupt and status register (CEC_ISR)

Address offset: 0x10

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------|------|------|------------|-------|-------|-------|-------|------------|------------|-------|-------|-------|-----------|-------|-------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 |

Bits 31:13 Reserved, must be kept at reset value.

- Bit 12 **TXACHE**: Tx-missing acknowledge error
In transmission mode, TXACHE is set by hardware to inform application that no acknowledge was received. In case of broadcast transmission, TXACHE informs application that a negative acknowledge was received. TXACHE aborts message transmission and clears TXSOM and TXEOM controls.
TXACHE is cleared by software write at 1.
- Bit 11 **TXERR**: Tx-error
In transmission mode, TXERR is set by hardware if the CEC initiator detects low impedance on the CEC line while it is released. TXERR aborts message transmission and clears TXSOM and TXEOM controls.
TXERR is cleared by software write at 1.
- Bit 10 **TXUDR**: Tx-buffer underrun
In transmission mode, TXUDR is set by hardware if application was not in time to load TXDR before of next byte transmission. TXUDR aborts message transmission and clears TXSOM and TXEOM control bits.
TXUDR is cleared by software write at 1
- Bit 9 **TXEND**: End of transmission
TXEND is set by hardware to inform application that the last byte of the CEC message has been successfully transmitted. TXEND clears the TXSOM and TXEOM control bits.
TXEND is cleared by software write at 1.
- Bit 8 **TXBR**: Tx-byte request
TXBR is set by hardware to inform application that the next transmission data has to be written to TXDR. TXBR is set when the 4th bit of currently transmitted byte is sent. Application must write the next byte to TXDR within six nominal data-bit periods before transmission underrun error occurs (TXUDR).
TXBR is cleared by software write at 1.
- Bit 7 **ARBLST**: Arbitration lost
ARBLST is set by hardware to inform application that CEC device is switching to reception due to arbitration lost event following the TXSOM command. ARBLST can be due either to a contending CEC device starting earlier or starting at the same time but with higher HEADER priority. After ARBLST assertion TXSOM bit keeps pending for next transmission attempt.
ARBLST is cleared by software write at 1.
- Bit 6 **RXACHE**: Rx-missing acknowledge
In receive mode, RXACHE is set by hardware to inform application that no acknowledge was seen on the CEC line. RXACHE applies only for broadcast messages and in listen mode also for not directly addressed messages (destination address not enabled in OAR). RXACHE aborts message reception.
RXACHE is cleared by software write at 1.
- Bit 5 **LBPE**: Rx-long bit period error
LBPE is set by hardware in case a data-bit waveform is detected with long bit period error. LBPE is set at the end of the maximum bit-extension tolerance allowed by RXTOL, in case falling edge is still longing. LBPE always stops reception of the CEC message. LBPE generates an error-bit on the CEC line if LBPEGEN = 1. In case of broadcast, error-bit is generated even in case of LBPEGEN = 0.
LBPE is cleared by software write at 1.
- Bit 4 **SBPE**: Rx-short bit period error
SBPE is set by hardware in case a data-bit waveform is detected with short bit period error. SBPE is set at the time the anticipated falling edge occurs. SBPE generates an error-bit on the CEC line.
SBPE is cleared by software write at 1.

Bit 3 **BRE**: Rx-bit rising error

BRE is set by hardware in case a data-bit waveform is detected with bit rising error. BRE is set either at the time the misplaced rising edge occurs, or at the end of the maximum BRE tolerance allowed by RXTOL, in case rising edge is still longing. BRE stops message reception if BRESTP = 1. BRE generates an error-bit on the CEC line if BREGEN = 1.
BRE is cleared by software write at 1.

Bit 2 **RXOVR**: Rx-overflow

RXOVR is set by hardware if RXBR is not yet cleared at the time a new byte is received on the CEC line and stored into RXD. RXOVR assertion stops message reception so that no acknowledge is sent. In case of broadcast, a negative acknowledge is sent.
RXOVR is cleared by software write at 1.

Bit 1 **RXEND**: End of reception

RXEND is set by hardware to inform application that the last byte of a CEC message is received from the CEC line and stored into the RXD buffer. RXEND is set at the same time of RXBR.
RXEND is cleared by software write at 1.

Bit 0 **RXBR**: Rx-byte received

The RXBR bit is set by hardware to inform application that a new byte has been received from the CEC line and stored into the RXD buffer.
RXBR is cleared by software write at 1.

59.7.6 CEC interrupt enable register (CEC_IER)

Address offset: 0x14

Reset value: 0x0000 0000

Caution: It is mandatory to write CEC_IER only when CECEN = 0.

Bit 12 **TXACKIE**: Tx-missing acknowledge error interrupt enable

The TXACKIE bit is set and cleared by software.
0: TXACKIE interrupt disabled
1: TXACKIE interrupt enabled

Bit 11 **TXERRIE**: Tx-error interrupt enable

The TXERRIE bit is set and cleared by software.
0: TXERR interrupt disabled
1: TXERR interrupt enabled

Bit 10 **TXUDRIE**: Tx-underrun interrupt enable

The TXUDRIE bit is set and cleared by software.
0: TXUDR interrupt disabled
1: TXUDR interrupt enabled

- Bit 9 **TXENDIE**: Tx-end of message interrupt enable
The TXENDIE bit is set and cleared by software.
0: TXEND interrupt disabled
1: TXEND interrupt enabled
- Bit 8 **TXBRIE**: Tx-byte request interrupt enable
The TXBRIE bit is set and cleared by software.
0: TXBR interrupt disabled
1: TXBR interrupt enabled
- Bit 7 **ARBLSTIE**: Arbitration lost interrupt enable
The ARBLSTIE bit is set and cleared by software.
0: ARBLST interrupt disabled
1: ARBLST interrupt enabled
- Bit 6 **RXACKIE**: Rx-missing acknowledge error interrupt enable
The RXACKIE bit is set and cleared by software.
0: RXACKE interrupt disabled
1: RXACKE interrupt enabled
- Bit 5 **LBPEIE**: Long bit period error interrupt enable
The LBPEIE bit is set and cleared by software.
0: LBPE interrupt disabled
1: LBPE interrupt enabled
- Bit 4 **SBPEIE**: Short bit period error interrupt enable
The SBPEIE bit is set and cleared by software.
0: SBPE interrupt disabled
1: SBPE interrupt enabled
- Bit 3 **BREIE**: Bit rising error interrupt enable
The BREIE bit is set and cleared by software.
0: BRE interrupt disabled
1: BRE interrupt enabled
- Bit 2 **RXOVRIE**: Rx-buffer overrun interrupt enable
The RXOVRIE bit is set and cleared by software.
0: RXOVR interrupt disabled
1: RXOVR interrupt enabled
- Bit 1 **RXENDIE**: End of reception interrupt enable
The RXENDIE bit is set and cleared by software.
0: RXEND interrupt disabled
1: RXEND interrupt enabled
- Bit 0 **RXBRIE**: Rx-byte received interrupt enable
The RXBRIE bit is set and cleared by software.
0: RXBR interrupt disabled
1: RXBR interrupt enabled

59.7.7 HDMI-CEC register map

Refer to [Section 2.3](#) for the register boundary addresses.

60 Debug infrastructure

60.1 Introduction

The debug infrastructure allows software designers to debug and trace their embedded software.

The debug features can be controlled via a JTAG/Serial-wire debug access port, using industry standard debugging tools. A trace port captures data for logging and analysis.

The trace and debug system is designed to support a variety of typical use cases:

- **Low cost trace**

Limited trace capability is available over the single-wire debug output. This supports code instrumentation using “printf”, tracing of data and address watchpoints, interrupt detection and program counter sampling. Single-wire trace can be maintained even when the processor is switched off or clock-stopped.
- **Breakpoint debugging**

The processor can be debugged using equipment connected to the JTAG/SWD debug port. This allows breakpoint and watchpoint setting, code stepping, memory access, and so on.
- **Tracing code execution via the trace port**

Trace information is combined into a single trace stream and output to a real-time trace port analyzer. An ID embedded in the trace allows the analyzer to identify the source of each information packet.
- **Continuous trace capturing in a circular buffer**

Instead of streaming it off-chip, the combined trace information can be stored on-chip in a circular buffer. The trace storage can be started and stopped by different means such as a debugger command, a software command, an external trigger signal or an internal event.
- **Draining the buffer to the trace port**

The stored trace can be dumped off-chip to the trace port analyzer. The buffer draining can be initiated by different means such as debugger, software, external trigger or internal event.
- **Reading the buffer with the debugger**

The debugger can read the contents of the trace buffer via the debug port. This is slower than the trace port, but allows basic trace functionality on the debugger without the cost of a trace port analyzer.
- **Analyzing stored trace in software**

The trace buffer can be read by the processor core, or transferred into system memory by DMA. This powerful feature allows built-in test software to monitor real-time code execution, analyze and identify faults, handle exceptions autonomously, and so on.
- **Uploading stored trace**

The stored trace can also be uploaded to a host machine using one of the MCU's many communications interfaces (such as USB, USART, SPI, I2C, Ethernet or CAN). This is especially useful if the trace port is not accessible, for example remote monitoring and failure analysis of a deployed product.

60.2 Debug infrastructure features

A comprehensive set of trace and debug features is provided to support software development and system integration:

- Breakpoint debugging
- Code execution tracing
- Software instrumentation
- Cross-triggering
- JTAG debug port
- Serial-wire debug port
- Trigger input and output
- Serial-wire trace port
- Trace port
- Arm® CoreSight™ debug and trace components

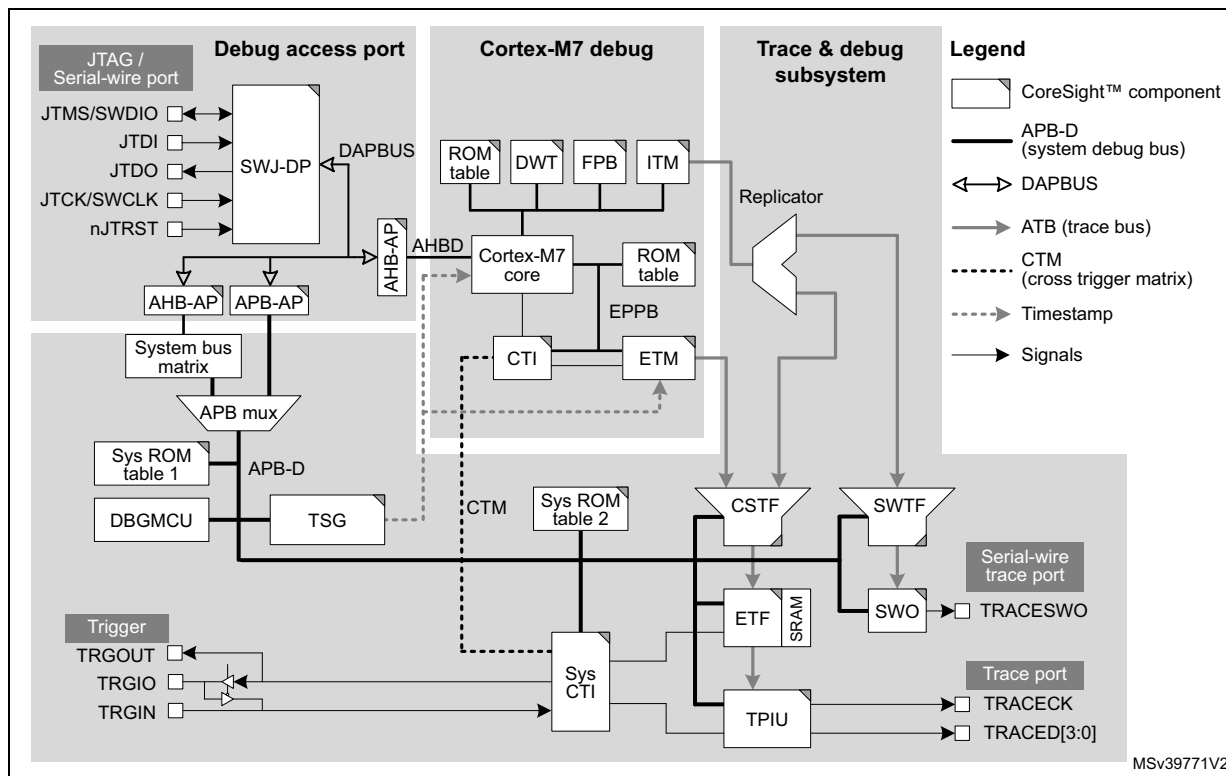

The CoreSight components are described at high level in this document. Detailed information is available in the Arm® documents referenced in [Section 60.7](#).

60.3 Debug infrastructure functional description

60.3.1 Debug infrastructure block diagram

The block diagram shows the logical partitioning of the debug infrastructure.

Figure 827. Block diagram of debug infrastructure

60.3.2 Debug infrastructure pins and internal signals

Table 594. JTAG/Serial-wire debug port pins

| Pin name | JTAG debug port | | SW debug port | | Pin assignment |
|------------|-----------------|-----------------------|---------------|-------------------------|----------------|
| | Type | Description | Type | Description | |
| JTMS/SWDIO | I | JTAG test mode select | IO | Serial wire data in/out | PA13 |
| JTCK/SWCLK | I | JTAG test clock | I | Serial wire clock | PA14 |
| JTDI | I | JTAG test data input | - | - | PA15 |
| JTDO | O | JTAG test data output | - | - | PB3 |
| nJTRST | I | JTAG test reset | - | - | PB4 |

Table 595. Trace port pins

| Pin name | Type | Description | Pin assignment |
|----------|------|------------------------------|--------------------|
| TRACED0 | O | Trace synchronous data out 0 | Refer to datasheet |
| TRACED1 | O | Trace synchronous data out 1 | |
| TRACED2 | O | Trace synchronous data out 2 | |
| TRACED3 | O | Trace synchronous data out 3 | |
| TRACECK | O | Trace clock | |

Table 596. Serial-wire trace port pins

| Pin name | Type | Description | Pin assignment |
|----------|------|---|--------------------|
| TRACESWO | O | Single wire trace asynchronous data out | PB3 ⁽¹⁾ |

1. TRACESWO is multiplexed with JTDO. This means that single wire trace is only available when using the serial wire debug interface, not when using JTAG

Table 597. Trigger pins

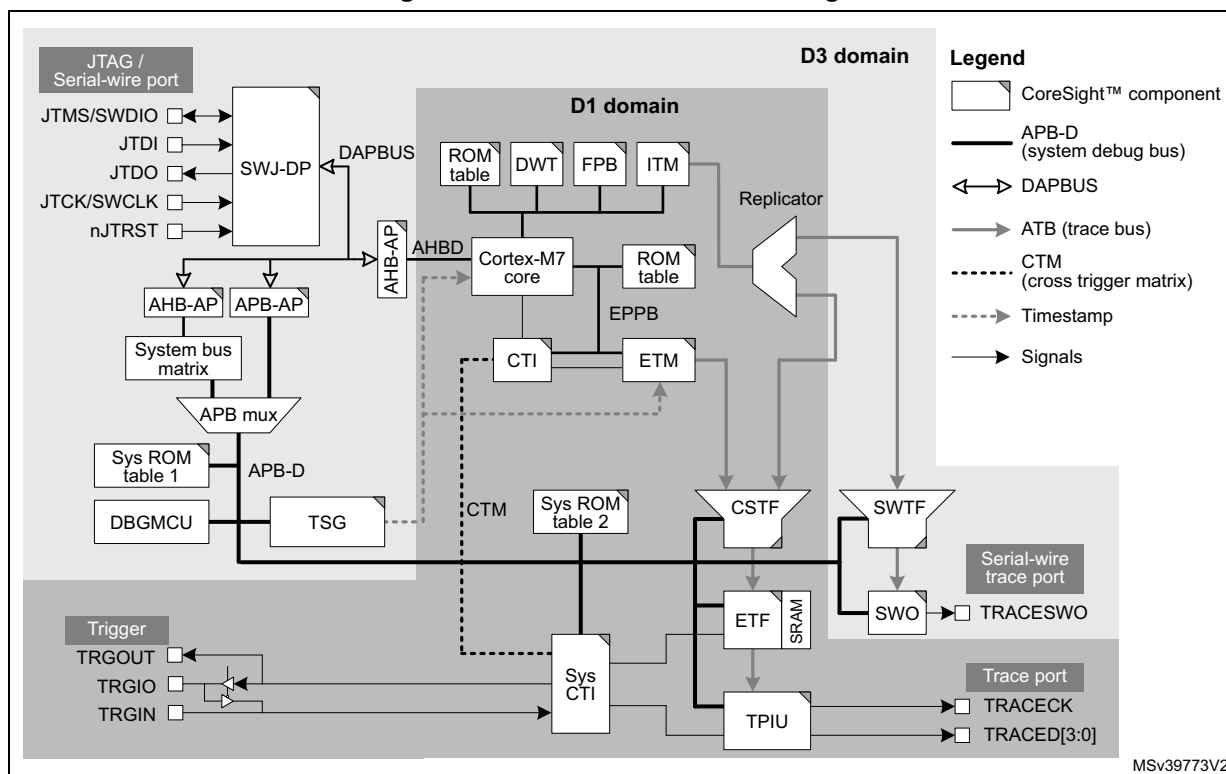

| Pin name | Type | Description | Pin assignment |
|----------|------|--|--------------------|
| TRGIN | I | External trigger input | Refer to datasheet |
| TRGOUT | O | External trigger output | |
| TRGIO | IO | External trigger bi-directional ⁽¹⁾ | |

1. TRGIO can be configured as an input or an output by the TRGOEN bit in the DBGMCU. If configured as an input, it is connected to TRGIN. If an output, it is connected to TRGOUT. This is because TRGIN and TRGOUT are not available on certain packages.

60.3.3 Debug infrastructure powering, clocking and reset

Power domains

Figure 828. Power domains of debug infrastructure

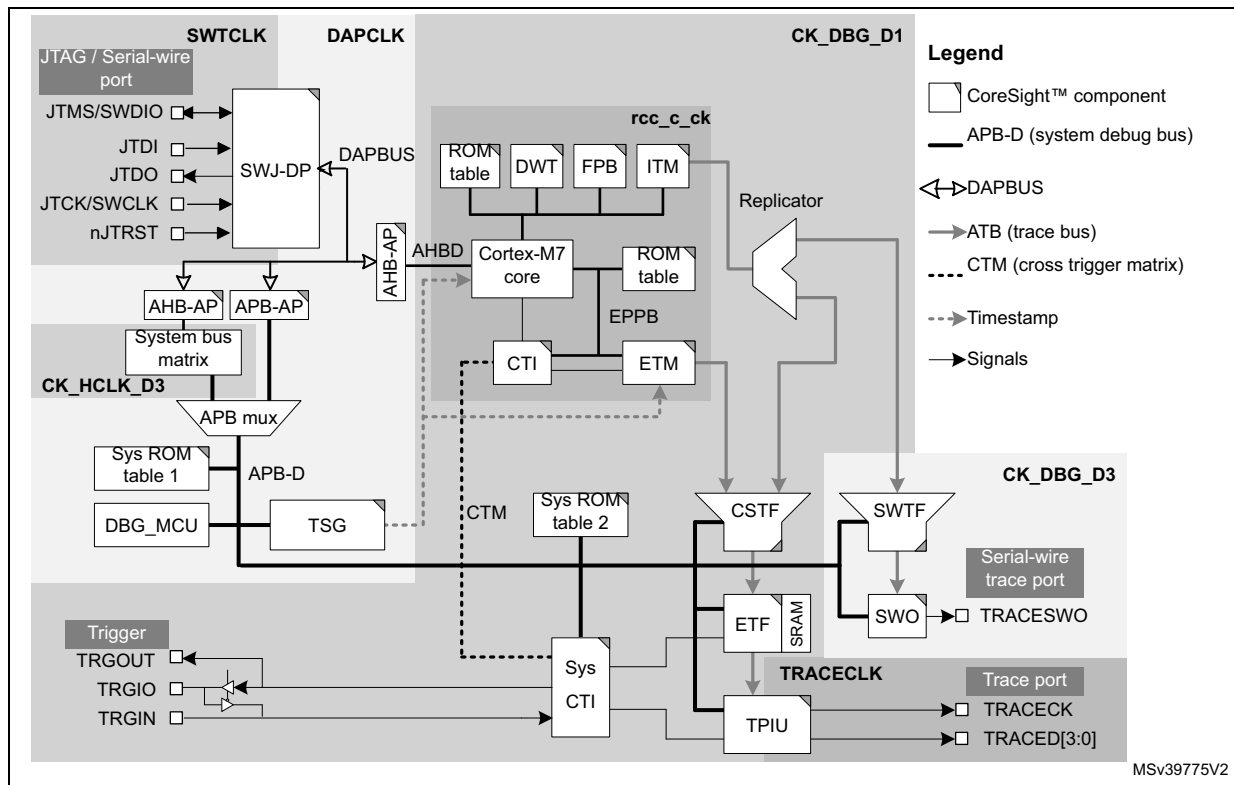

The debug components are distributed across the power domains D1 and D3. The D3 power domain is always considered to be on when the debugger is connected. It therefore contains the SWJ-DP, so that the debugger does not lose the connection with the SoC when the other power domain is switched off. In addition, it contains the timestamp generator, the DBGMCU and the serial wire trace features.

The D1 power domain contains the Cortex-M7 core and the associated debug and trace components. It also contains the system trace components located on the APB-D. This power domain therefore needs to be on whenever a debug access to the Cortex-M7 is required, or whenever a trace functionality is active on the processor.

Clock domains

Figure 829. Clock domains of debug infrastructure

The debugger supplies the clock for the debug port, SWCLK, via the debug interface pin, JTCK/SWCLK. This clock is used to register the serial input data in both serial wire and JTAG mode, as well as to operate the state machines and internal logic of the debug port. It must therefore continue to toggle for several cycles after the end of an access, to ensure that the debug port returns to the idle state.

The SWJ-DP contains an asynchronous interface to the DAPCLK domain, which covers the rest of the SWJ-DP and the access ports. The DBGMCU, timestamp generator and System ROM table 1 are also in the DAPCLK domain.

CK_DBG_D3 clocks the SWO and serial wire trace funnel.

Both DAPCLK and CK_DBG_D3 are gated versions of the D3 domain system clock (rcc_hclk4).

CK_DBG_D1 clocks the trace components in the D1 power domain: System ROM table 2, CoreSight trace funnel, ETF, system CTI and TPIU. It is a gated version of the D1 domain system clock (rcc_hclk3).

TRACECLK is the trace port output clock. It is derived from the PLL1 R divider output (pll1_r_ck).

All the debug clocks (except DAPCLK) can be enabled and disabled by register bits in the DBGMCU. The DAPCLK domain is enabled by the debugger using the CDBGPWRUPREQ bit in the debug port CTRL/STAT register. The clock must be enabled before the debugger can access any of the debug features on the device. It should be disabled at power up and when the debugger is disconnected, to avoid wasting energy.

The debug and trace components included in the processor (such as ETM ITM, DWG and FPB) are clocked with the corresponding core clock (rcc_c_ck).

Debug with low-power modes

The device includes power-saving features allowing individual power domains to be switched off or stopped when not required. If a power domain is switched off or not clocked, all debug components in that domain are inaccessible to the debugger. To avoid this, power saving mode emulation is implemented. If the emulation is enabled for a domain, the domain still enters power saving mode, but its clock and power are maintained. In other words, the domain behaves as if it is in power saving mode, while the debugger does not lose the connection.

The emulation mode is programmed in the MCU Debug (DBGMCU) unit. For more information, refer to [Section 60.5.8](#)

Reset of debug infrastructure

The debug components, except for the debug port and access ports, are reset by their respective power domain resets. The debug port (SWJ-DP) is reset by a power-on reset of the D3 domain only.

60.4 Debug access port functional description

The debug access port (DAP) is a debug subsystem comprising serial-wire and JTAG debug port (SWJ-DP) and three access ports.

60.4.1 Serial-wire and JTAG debug port (SWJ-DP)

The SWJ-DP is a CoreSight component that implements an external access port for connecting debugging equipment.

The port can be configured as:

- a 5-pin standard JTAG debug port (JTAG-DP)
- a 2-pin (clock + data) “serial-wire” debug port (SW-DP)

The two modes are mutually exclusive, since they share the same IO pins.

By default, the JTAG-DP is selected on system or power-on reset. The five IOs are configured by hardware in debug alternative function mode. The SWJ-DP incorporates pull-up resistors on the JTDI, JTMS/SWDIO, and nJTRST lines, as well as a pull-down resistor on the JTCK/SWCLK line.

A debugger can select the SW-DP by transmitting the following serial data sequence on JTMS/SWDIO:

..., (50 or more ones), ..., 0, 1, 1, 1, 1, 0, 0, 1, 1, 1, 1, 0, 0, 1, 1, 1, ..., (50 or more ones), ...

JTCK/SWCLK must be cycled for each data bit.

In SW-DP mode, the unused JTAG lines JTDI, JTDO and nJTRST can be used for other functions.

All SWJ port IOs can be reconfigured to other functions by software, in which case debugging is no longer possible.

Serial wire debug port

The Serial wire debug protocol uses two pins:

- SWCLK: clock from host to target
- SWDIO: bi-directional serial data (100kΩ pull-up required)

Serial data is transferred LSB first, synchronously with the clock. A transfer comprises three phases:

1. packet request (8 bits) transmitted by the host
2. acknowledge response (3 bits) transmitted by the target
3. data transfer (33 bits) transmitted by the host (in the case of a write) or target (in the case of a read)

The data transfer only occurs if the acknowledge response is OK.

If the direction of the data is reversed between each phase, a single clock cycle turn-around time is inserted.

Table 598. Packet request

| Field bits | Name | Description |
|------------|--------|--|
| 0 | Start | Must be “1” |
| 1 | APnDP | 0: DP register access - see Table 602 for a list of DP registers 1: AP register access - see Section 60.4.2 |
| 2 | RnW | 0: Write request 1: Read request |
| 4:3 | A(3:2) | Address field of the DP or AP register (refer to Table 602 and Table 603) |
| 5 | Parity | Single bit parity of preceding bits |
| 6 | Stop | 0 |
| 7 | Park | Not driven by host. Must be read as “1” by target. |

Table 599. ACK response

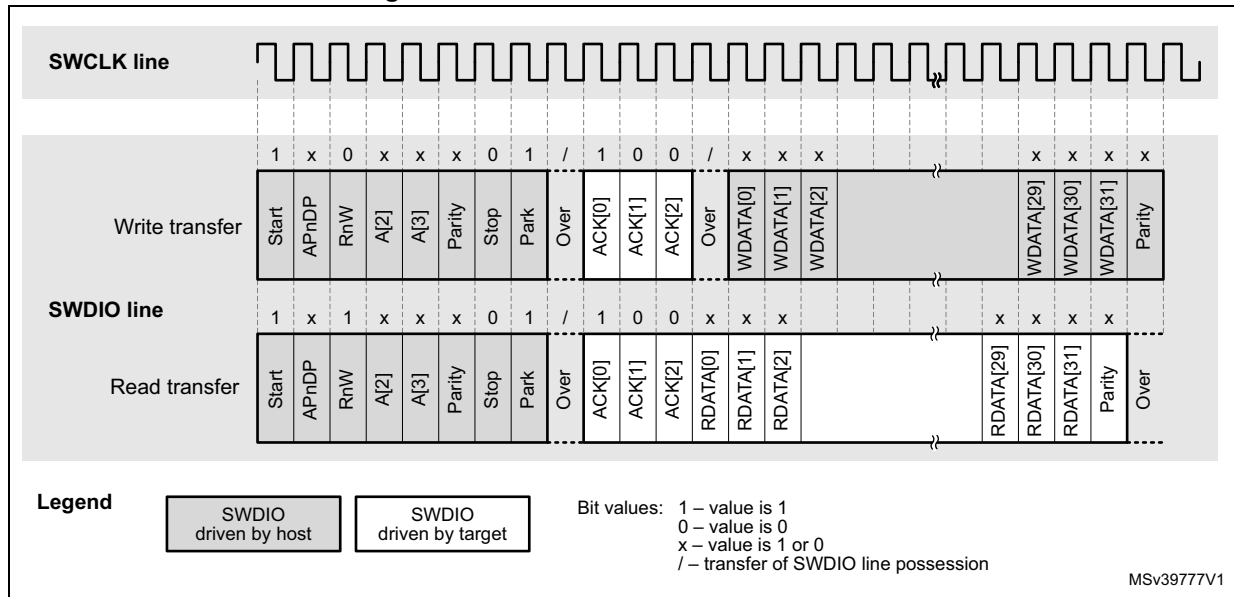

| Field bits | Name | Description |
|------------|------|---------------------------------------|
| 2:0 | ACK | 000b: FAULT 010b: WAIT 100b: OK |

Table 600. Data transfer

| Bit field | Name | Description |
|-----------|----------------|-----------------------------------|
| 31:0 | WDATA or RDATA | Write or Read data |
| 32 | Parity | Single bit parity of 32 data bits |

[Figure 830](#) shows successful write and read transfers.

Figure 830. SWD successful data transfer

For any FAULT or WAIT ACK response from the target, the data transfer phase is canceled, unless overrun detection is enabled, in which case the data will be ignored by the target (in the case of a write), or not driven (in the case of a read).

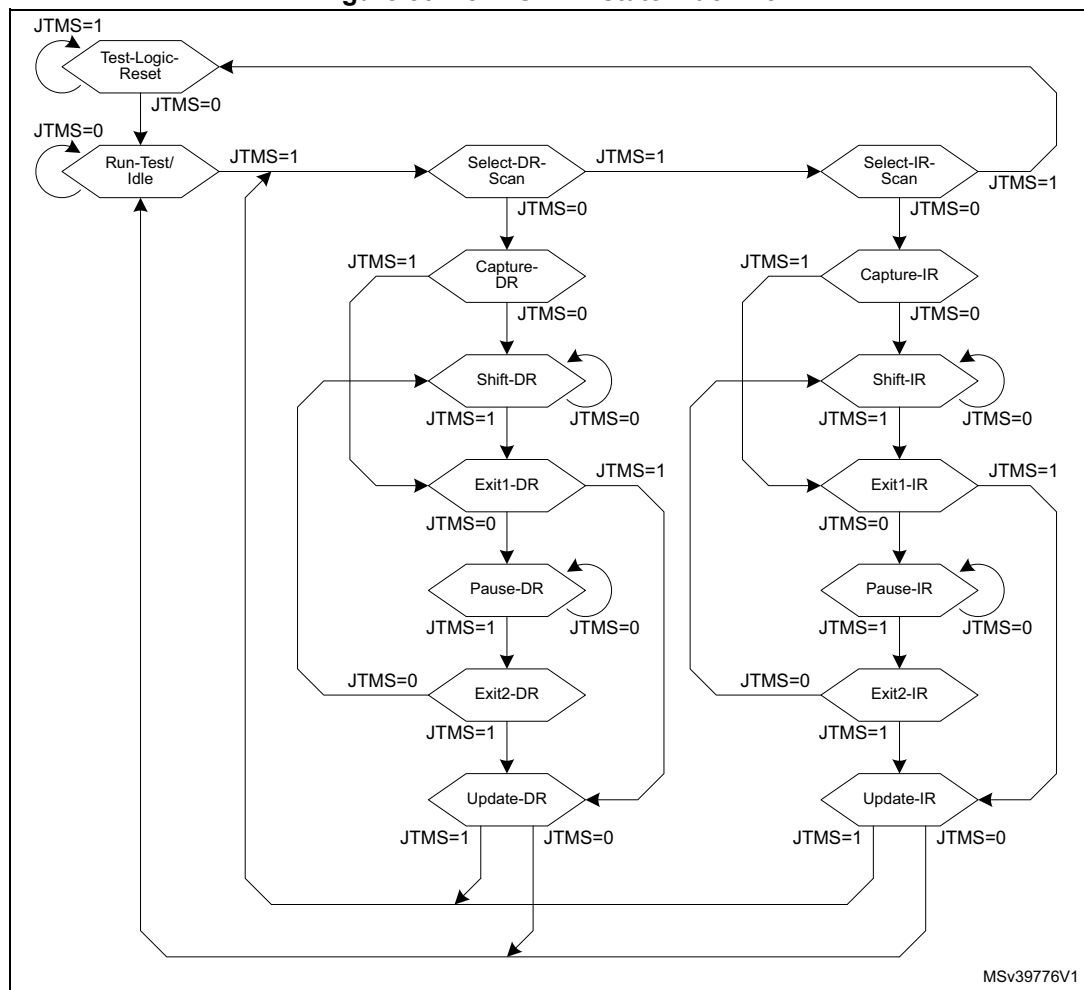

A line reset must be generated by the host when it is first connected, or following a protocol error. The line reset consists of 50 or more SWCLK cycles with SWDIO high, followed by two SWCLK cycles with SWDIO low.

For more details on the Serial Wire debug protocol, refer to the Arm® Debug Interface Architecture Specification [1].

Note: The SWJ-DP implements SWD protocol version 2.

JTAG debug port

Figure 831. JTAG TAP state machine

The JTAG-DP implements a TAP state machine (TAPSM) based on IEEE 1149.1-1990. The state machine is shown in [Figure 831](#). It controls two scan chains, one associated with an instruction register (IR) and one with a number of data registers (DR).

When the TAPSM goes through the Capture-IR state, 0b0001 is transferred to the instruction register (IR) scan chain. The IR scan chain is connected between JTDI and JTDO.

While the TAPSM is in the Shift-IR state, the IR scan chain shifts one bit for each rising edge of JTCK. This means that on the first tick:

- The LSB of the IR scan chain is output on JTDO.
- Bit [n] of the IR scan chain is transferred to bit [n-1].
- The value on JTDI is transferred to the MSB of the IR scan chain.

When the TAPSM goes through the Update-IR state, the value scanned in the IR scan chain is transferred to the instruction register.

When the TAPSM goes through the Capture-DR state, a value is transferred from one of the data registers onto one of the DR scan chains, connected between JTDI and JTDO.

The value held in the instruction register determines which data register, and associated DR scan chain, is selected.

This data is then shifted while the TAPSM is in the Shift-DR state, in the same way as the IR shift in the Shift-IR state.

When the TAPSM goes through the Update-DR state, the value scanned in the DR scan chain is transferred to the selected data register.

When the TAPSM is in the Run-Test/Idle state, no special actions occur. The IDCODE instruction is loaded in IR.

When active, the nJTRST signal resets the state machine asynchronously to the Test-Logic-Reset state.

The data registers corresponding to the 4-bit IR instructions are listed in [Table 601](#).

Table 601. JTAG-DP data registers

| Instruction register | Data register | Scan chain length | Description |
|----------------------|---------------|-------------------|--|
| 0000 to 0111 | (BYPASS) | 1 | Not implemented: BYPASS selected |
| 1000 | ABORT | 35 | Abort register – Bits 31:1 = reserved – Bit 0 = APABORT: write 1 to generate an AP abort |
| 1001 | (BYPASS) | 1 | Reserved: BYPASS selected |
| 1010 | DPACC | 35 | Debug port access register Initiates the debug port and allows access to a debug port register. – When transferring data IN: Bits 34:3 = DATA[31:0] = 32-bit data to transfer for a write request Bits 2:1 = A[3:2] = 2-bit address of a debug port register. Bit 0 = RnW = Read request (1) or write request (0). – When transferring data OUT: Bits 34:3 = DATA[31:0] = 32-bit data which is read following a read request Bits 2:0 = ACK[2:0] = 3-bit Acknowledge: 010b = OK/FAULT 001b = WAIT Others: reserved |

Table 601. JTAG-DP data registers (continued)

| Instruction register | Data register | Scan chain length | Description |
|----------------------|---------------|-------------------|--|
| 1011 | APACC | 35 | <p>Access port access register Initiates an access port and allows access to an access port register.</p> <p>– When transferring data IN: Bits 34:3 = DATA[31:0] = 32-bit data to shift in for a write request Bits 2:1 = A[3:2] = 2-bit sub-address of an access port register. Bit 0 = RnW= Read request (1) or write request (0).</p> <p>– When transferring data OUT: Bits 34:3 = DATA[31:0] = 32-bit data which is read following a read request Bits 2:0 = ACK[2:0] = 3-bit Acknowledge: 010b = OK/FAULT 001b = WAIT OTHER = reserved</p> |
| 1100 | (BYPASS) | 1 | Reserved: BYPASS selected |
| 1101 | (BYPASS) | 1 | Reserved: BYPASS selected |
| 1110 | IDCODE | 32 | <p>ID Code 0x6BA0 0477: Arm® JTAG debug port ID code</p> |
| 1111 | BYPASS | 1 | <p>Bypass A single JTCK cycle delay is inserted between JTDI and JTDO</p> |

The DR registers are described in more detail in the Arm® Debug Interface Architecture Specification [1].

Debug port registers

The SW-DP and JTAG-DP both access the debug port (DP) registers. These are listed in [Table 602](#).

The debugger can access the DP registers as follows:

1. Program the SELECT register DPBANKSEL field in the DP to select the register bank to be accessed (see [Table 602](#))
2. Program the A(3:2) field in the DPACC register, if using JTAG, with the register address within the bank. Program the R/W bit to select a read or a write. In the case of a write, program the DATA field with the write data. If using SWD, the A(3:2) and R/W fields are part of the Packet Request word sent to the SW-DP with the APnDP bit reset (see [Table 598](#)). The write data is sent in the data phase.

Table 602. Debug port registers

| Address | A(3:2) field value | R/W | Description |
|---------|--------------------|-----|--|
| 0x0 | 00 | R | DP_DPIDR register ⁽²⁾ . It contains the IDCODE for the debug port. |
| | | W | DP_ABORT register ⁽¹⁾ . It aborts the current AP transaction. This register is also used to clear the error flags in the DP_CTRL/STAT register. |
| 0x4 | 01 | R/W | If DPBANKSEL[3:0] = 0x0 (DP_SELECT register): CTRL/STAT register. It controls the DP and provides status information. |
| | | | If DPBANKSEL[3:0] = 0x1 (DP_SELECT register): DP_DLCR register ⁽²⁾ . It controls the operating mode of the SWD Data Link. |
| | | | If DPBANKSEL[3:0] = 0x2 (DP_SELECT register): DP_TARGETID register. It provides target identification information. |
| | | | If DPBANKSEL[3:0] = 0x3 (DP_SELECT register): DLPIDR register ⁽²⁾ . It provides the SWD protocol version. |
| 0x8 | 10 | R | RESEND register ⁽²⁾ . It returns the value that was returned by the last AP read or DP_RDBUFF read, used in the event of a corrupted read transfer. |
| | | W | DP_SELECT register. It selects the access port, access port register bank, and DP register at address 0x4. |
| 0xC | 11 | R | DP_RDBUFF register Via JTAG-DP, it enables the debugger to get the final result after a sequence of operations (without requesting new JTAG-DP operation). Via SW-DP, it contains the result of the preceding AP read access, allowing a new AP access to be avoided. |
| | | W | DP_TARGETSEL register ⁽²⁾ . On a write to DP_TARGETSEL immediately following a line reset sequence, the target is selected if the following conditions are both met: – Bits [31:28] match bits [31:28] in the DP_DLPIDR register. – Bits [27:0] match bits [27:0] in the DP_TARGETID register. Writing any other value deselects the target. Debug tools must write 0xFFFFFFFF to deselect all targets. This is an invalid DP_TARGETID value. All other invalid DP_TARGETID values are reserved. |

1. Access to the AP ABORT register from the JTAG-DP is done using the ABORT instruction.
2. Only accessible via SW-DP. Register is “reserved” via JTAG-DP.

Bit 31 **CSYSPWRUPACK**: System domain power-up status bit - not used in this device

Bit 30 **CSYSPWRUPREQ**: System domain power-up control bit - not used in this device

Bit 29 **CDBGPWRUPACK**: Debug domain power-up status bit

This bit is read-only. It returns the status of the debug domain power-up acknowledge signal from the power controller.

- 0: domain powered down
- 1: domain powered up

Bit 28 **CDBGPWRUPREQ**: Debug domain power-up/down control bit

This bit controls the debug domain power-up/down request signal to the power controller.

- 0: power-down requested
- 1: power-up requested

Bit 27 **CDBGGRSTACK**: Debug domain reset status bit - not used in this device

Bit 26 **CDBGRESTREQ**: Debug domain reset control bit - not used in this device

Bits 25:24 Reserved, must be kept at reset value.

Bits 23:12 **TRNCNT[11:0]**: Transaction counter

To program a sequence of transactions to incremental addresses via an AP, TRNCNT bits are loaded with the number of transactions to perform. It is decremented on successful completion of each transaction.

Bits 11:8 **MASKLANE[3:0]**: Pushed-compare and pushed-verify masking bits

The field indicates the bytes to be masked in pushed-compare and pushed-verify operations (DP_CTRL/STAT register's field TRNMODE = 1 or 2). In the pushed operations, the word supplied in an AP write transaction is compared with the current value at the target AP address.

0b1XXX: include byte lane 3 in comparisons

0bX1XX: include byte lane 2 in comparisons

0bXX1X: include byte lane 1 in comparisons

0bXXX1: include byte lane 0 in comparisons

Bit 7 **WDATAERR**: Write data error in SW-DP

The bit indicates

- a parity or a framing error on the data phase of a write operation, or
- a write operation that had been accepted by the DP has then been discarded without being submitted to the AP

This bit is read-only. It is reset by writing 1 to the WDERRCLR bit of the DP_ABORT register.

0: No error

1: Error has occurred

This bit is reserved in JTAG-DP.

Bit 6 **READOK**: AP read response in SW-DP

This bit indicates the response to the last AP read access. It is read-only.

0: Read not OK

1: Read OK

This bit is Reserved in JTAG-DP.

Bit 5 **STICKYERR**: Transaction error (read-only in SW-DP, R/W in JTAG-DP)

This bit indicates that an error occurred during an AP transaction.

0: No error

1: Error has occurred

In the SW-DP, this bit is reset by writing 1 to the STKERRCLR bit of the DP_ABORT register. In the JTAG-DP, this bit is reset by programming it to 1.

Bit 4 **STICKYCMP**: Compare match (read-only in SW-DP, R/W in JTAG-DP)

This bit indicates that a match occurred in a pushed operation.

- 0: Match if TRNMODE = 0x1; no match if TRNMODE = 0x2
- 1: No match if TRNMODE = 0x1; match if TRNMODE = 0x2

In the SW-DP, this bit is reset by writing 1 to the STKCMPLR bit in the DP_ABORT register. In the JTAG-DP, this bit is reset by programming it to 1.

Bits 3:2 **TRNMODE[1:0]**: Transfer mode for AP write operations

For read operations, this field must be set to 0x0.

- 0x0: Normal operation - AP transactions are passed directly to the AP.
- 0x1: Pushed-verify operation. The DP stores the write data and performs a read transaction at the target AP address. The result of the read operation is compared with the stored data. If they do not match, the STICKYCMP bit is set.
- 0x2: Pushed-compare operation. The DP stores the write data and performs a read transaction at the target AP address. The result of the read is compared with the stored data. If they match, the STICKYCMP bit is set.
- 0x3: Reserved

In pushed operations, only the data bytes indicated by the MASKLANE field are included in the comparison.

Bit 1 **STICKYORUN**: Overrun (read-only in SW-DP, R/W in JTAG-DP)

This bit indicates that an overrun occurred (new transaction received before previous transaction completed). This bit is only set if the ORUNDETECT bit is set.

- 0: No overrun
- 1: Overrun occurred

In the SW-DP, this bit is reset by writing 1 to the ABORT register's ORUNERRCLR bit. In the JTAG-DP, this bit is reset by writing a 1 to it.

Bit 0 **ORUNDETECT**: Overrun detection mode enable

- 0: Overrun detection disabled
- 1: Overrun detection enabled. In the event of an overrun, the STICKYORUN bit is set and subsequent transactions are blocked until the STICKYORUN bit is cleared.

Bits 31:28 **TINSTANCE[3:0]**: Target instance number
 These bits define the instance number for this device in a multi-drop system.
 0x0

Bits 27:4 Reserved, must be kept at reset value.

Bits 3:0 **PROTSVN[3:0]**: Serial Wire Debug protocol version
 0x1: Version 2

Debug port resend register (DP_RESEND)

Address offset: 0x8

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|---------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:0 **RESEND[31:0]**: Last AP read or DP RDBUFF read value
 These bits contain the value that was returned by the last AP read or DP RDBUFF read.
 Used in the event of a corrupted read transfer.

Debug port access port select register (DP_SELECT)

Address offset: 0x8

Reset value: 0xXXXX XXXX

| | | | | | | | | | | | | | | | |
|------------|------|------|------|------|------|------|------|----------------|------|------|------|----------------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| APSEL[3:0] | | | | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| w | w | w | w | | | | | | | | | | | | |

| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | APBANKSEL[3:0] | | | | DPBANKSEL[3:0] | | | |
| | | | | | | | | w | w | w | w | w | w | w | w |

Bits 31:28 **APSEL[3:0]**: Access port select bits
 These bits select the access port for the next transaction.

- 0x0: AP0 - Cortex-M7 debug access port (AHB-AP)
- 0x1: AP1 - D3 access port (AHB-AP)
- 0x2: AP2 - System debug access port (APB-AP)
- 0x3 to 0xF: Reserved

Bits 27:8 Reserved, must be kept at reset value.

Bits 7:4 **APBANKSEL[3:0]**: AP register bank select bits
 These bits select the 4-word register bank on the active AP for the next transaction.

Bits 3:0 **DPBANKSEL[3:0]**: DP register bank select bits
 These bits select the register at address 0x4 of the debug port.

- 0x0: CTRL/STAT register
- 0x1: DLCR register
- 0x2: TARGETID register
- 0x3: DLPIDR register
- 0x4 to 0xF: Reserved

Debug port read buffer register (DP_RDBUFF)

Address offset: 0xC

Reset value: 0x0000 0000

Bits 31:0 **RDBUFF[31:0]**: Last AP read value
 The field contains the value returned by the last AP read access. There are two ways to retrieve the value returned by an AP read access:

- perform a second read access to the same address, which initiates a new transaction on the corresponding bus, or
- read the value returned by the last AP read access from the DP_RDBUFF register, in which case no new AP transaction occurs

Debug port target identification register (DP_TARGETSEL)

Address offset: 0xC

Reset value: N/A

| | | | | | | | | | | | | | | | |
|----------------|----|----|----|-----------------|----|----|----|----|----|----|----|----|----|----|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| TINSTANCE[3:0] | | | | TPARTNO[15:4] | | | | | | | | | | | |
| w | w | w | w | w | w | w | w | w | w | w | w | w | w | w | w |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| TPARTNO[3:0] | | | | TDESIGNER[10:0] | | | | | | | | | | | Res. |
| w | w | w | w | w | w | w | w | w | w | w | w | w | w | w | w |

Bits 31:28 **TINSTANCE[3:0]**: Target instance number

The field defines the instance number for the target device in a multi-drop system. It must be programmed with the same value as TINSTANCE field of DP_DLPIDR register, in order to select this device.

Bits 27:12 **TPARTNO[15:0]**: Target part number

The field defines the part number for the target device. It must be programmed with the same value as TPARTNO field of DP_TARGETID register, in order to select this device.

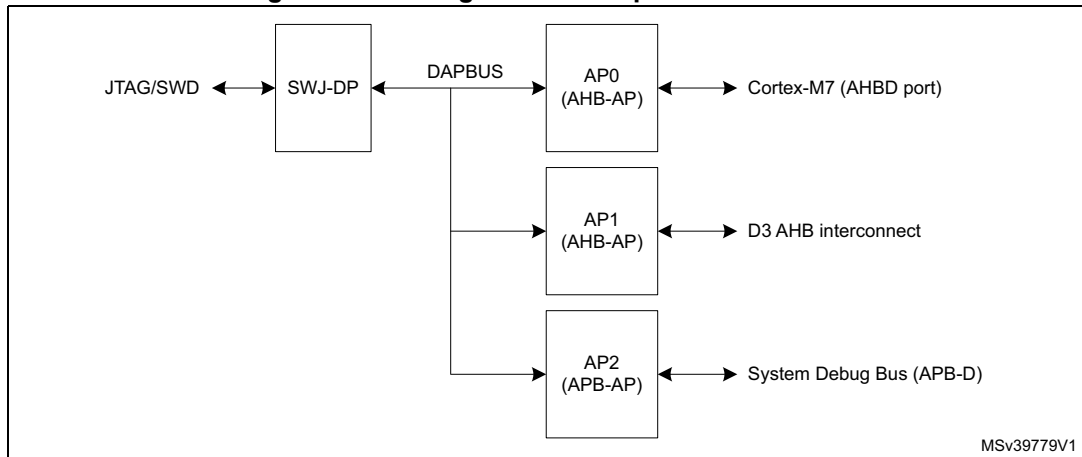

Bits 11:1 **TDESIGNER[10:0]**: Target designer JEDEC code

The field defines the JEDEC code for the target device. It must be programmed with the same value as TDESIGNER field of DP_TARGETID register, in order to select this device.

Bit 0 Reserved, must be kept at reset value.

60.4.2 Access ports

Figure 832. Debug and access port connections

The access ports (AP) attached to the DP as the following:

1. AP0: Cortex-M7 access port (AHB-AP). Allows access to the debug and trace features integrated in the Cortex-M7 processor core via an AHB-Lite bus connected to the AHBD port of the processor.
2. AP1: D3 access port (AHB-AP). Allows access to the bus matrix in the D3 domain. This gives visibility of the D3 domain memory and peripherals when the D1 and D2 domains are switched off. No CoreSight components are accessible via this port.
3. AP2: System access port (APB-AP). Allows access to the debug and trace features on the system APB debug bus, that is, all components not included in the processor core.

All access ports are of MEM-AP type, that is, the debug and trace component registers are mapped in the address space of the associated debug bus. The AP is seen by the debugger as a set of 32-bit registers organized in banks of four registers each. Some of these registers are used to configure or monitor the AP itself, while others are used to perform a transfer on the bus. The AP registers are listed in [Table 603](#).

The address of the AP registers is composed of:

- bits [7:4]: content of the DP_SELECT register's APBANKSEL field
- bits [3:2]: content of the A(3:2) field of the APACC data register in the JTAG-DP (see [Table 601](#)) or of the SW-DP Packet Request (see [Table 598](#)), depending on the debug interface used
- bits [1:0]: Always set to 0

The content of the SELECT register APSEL field in the DP define which MEM-AP is being accessed.

The debugger can access the AP registers as follows:

1. Program the DP_SELECT register's APSEL field to choose one of the APs, and the APBANKSEL field to select the register bank to be accessed.
2. Program the A(3:2) field in the APACC register, if using JTAG, with the register address within the bank. Program the RnW bit to select a read or a write. In the case of a write, program the DATA field with the write data. If using SWD, the A(3:2) and RnW fields are part of the Packet Request word sent to the SW-DP with the APnDP bit set (see [Table 598](#)). The write data is sent in the data phase.

The debugger can access the memory mapped debug component registers through the MEM-AP registers (using the AP register access procedure described above) as follows:

1. Program the transaction target address in the TAR register.
2. Program the CSW register, if necessary, with the transfer parameters (AddrInc for example).
3. Write to or read from the DRW register to initiate a bus transaction at the address held in the TAR register. Alternatively, a read or write to banked data register BDn triggers an access to address TAR[31:4] + n (this allows accessing up to four consecutive addresses without changing the address in the TAR register).

For more detailed information on the MEM-AP, refer to the Arm[®] Debug Interface Architecture Specification [1]. To use the MEM-AP to connect the debug port to the debug components (in the example, a processor, an ETM and a ROM table), go to [Section 60.6.2: Cortex-M7 data watchpoint and trace unit \(DWT\)](#).

MEM-AP registers

Table 603. MEM-AP registers

| Address | APBANKSEL | A(3:2) | Name | Description |
|-----------|-----------|--------|---------|--|
| 0x00 | 0x0 | 0 | AP_CS | Control/status word register |
| 0x04 | 0x0 | 1 | AP_TAR | Transfer address register Target address for the bus transaction. |
| 0x08 | - | - | - | Reserved |
| 0x0C | 0x0 | 3 | AP_DRW | Data read/write register Access to this register triggers a corresponding transaction on the debug bus to the address in TAR[31:0] |
| 0x10 | 0x1 | 0 | AP_BD0 | Banked data 0 register Access to this register triggers a corresponding transaction on the debug bus to the address in TAR[31:4] << 4 + 0x0 |
| 0x14 | 0x1 | 1 | AP_BD1 | Banked Data 1 register Access to this register triggers a corresponding transaction on the debug bus to the address in TAR[31:4] << 4 + 0x4 |
| 0x18 | 0x1 | 2 | AP_BD2 | Banked data 2 register Access to this register triggers a corresponding transaction on the debug bus to the address in TAR[31:4] << 4 + 0x8 |
| 0x1C | 0x1 | 3 | AP_BD3 | Banked data 3 register Access to this register triggers a corresponding transaction on the debug bus to the address in TAR[31:4] << 4 + 0xC |
| 0x20-0xEC | - | - | - | Reserved |
| 0xF0 | - | - | - | Reserved |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | MODE[3:0] | | | TRINP ROG | DEVIC EEN | ADDRINC[1:0] | | Res. | SIZE[2:0] | | | |
| | | | | rw | rw | rw | rw | r | r | rw | rw | | rw | rw | rw |

Bit 31 Reserved, must be kept at reset value.

Bit 30 **SPROT**: Secure transfer request bit

In the APB-AP, this field is reserved. In the AHB-APs, this field sets the protection attribute HPROT[6] of the bus transfer.

0: If SPIDEN is high, secure transfer. If SPIDEN is low, non-secure transfer.

1: Non-secure transfer.

Bit 29 Reserved, must be kept at reset value.

Bits 28:24 **PROT[4:0]** Bus transfer protection bits

In the APB-AP, this field is reserved. In the AHB-APs, this field sets the protection attributes HPROT[4:0] of the bus transfer.

0bXXXX0: Instruction fetch

0bXXXX1: Data access

0bXXX0X: User mode

0bXXX1X: Privileged mode

0bXX0XX: Non-bufferable

0bXX1XX: Bufferable

0bX0XXX: Non-cacheable

0bX1XXX: Cacheable

0b0XXXX: Non-exclusive

0b1XXXX: Exclusive

Bit 23 **SPISTATUS**: Status of SPIDEN option bit

This bit determines whether the debugger can access secure memory. This field is reserved in the APB-AP.

0: Secure AHB transfers are blocked

1: Secure AHB transfers are allowed

Bits 22:12 Reserved, must be kept at reset value.

Bits 11:8 **MODE[3:0]**: Barrier support enabled bit

These bits define if the memory barrier operation is supported.

0x0: Not supported

Bit 7 **TRINPROG**: Transfer in progress

This bit indicates that an AP bus transfer is in progress.

0: No transfer in progress.

1: Bus transfer in progress.

Bit 6 **DEVICEEN**: Device Enable bit
 This bit defines whether the AP can be accessed or not.

1: AP access enabled.

Bits 5:4 **ADDRINC[1:0]**: Auto-increment mode bits
 These bits define whether the TAR address is automatically incremented after a transaction.

- 0x0: no auto-increment
- 0x1: Address is incremented by the size in bytes of the transaction (SIZE field).
- 0x2: Packed transfers enabled (Only in AHB-APs - reserved in APB-AP). A 32-bit AP access generates a 1 x 32-bit, 2 x 16-bit or 4 x 8-bit bus transaction corresponding to the programmed transaction size. The data is packed or unpacked accordingly.
- 0x3: Reserved

Bit 3 Reserved, must be kept at reset value.

Bits 2:0 **SIZE[2:0]**: Size of next memory access transaction (only for AHB-APs)

- 0x0: Byte (8-bit)
- 0x1: Half-word (16-bit)
- 0x2: Word (32-bit)
- 0x3-0x7: Reserved

For APB-AP, this field is read-only and fixed at 0x2 (32-bit).

Access port base address register (AP_BASE)

Address offset: 0xF8

Reset value: 0xE00F E003 (AP0), 0x0000 0002 (AP1), 0xE00E 0003 (AP2)

| | | | | | | | | | | | | | | | |

| r | r | r | r | | | | | | | | | | | r | r |

Bits 31:12 **BASEADDR[19:0]**: Base address (bits 31 to 12) for the ROM AP table
 The 12 LSBs are zero since the ROM table must be aligned on a 4 Kbyte boundary.
 AP0 (Cortex-M7 AHB-AP): 0xE00FE
 AP1 (D3 AHB-AP): 0x00000 (No ROM table present)
 AP2 (System APB-AP): 0xE00E0

Bits 11:2 Reserved, must be kept at reset value.

Bit 1 **FORMAT**: Base address register format
 1: Arm® debug interface v5.

Bit 0 **ENTRYPRESENT**: Debug component present status bit
 This bit indicates that debug components are present on the access port bus.

 0: Debug components are not present (AP1)
 1: Debug components are present (AP0, AP2)

Access port identification register (AP_IDR)

Address offset: 0xFC

Reset value: 0x8477 0001 (AP0 and AP1), 0x5477 0002 (AP2)

| | | | | | | | | | | | | | | | |

Bits 31:28 **REVISION[3:0]**: Arm core revision
 0x5: r1p0 (AP2)
 0x8: r0p9 (AP0 and AP1)

Bits 27:24 **JEDEC BANK[3:0]**: JEDEC bank
 0x4: Arm®

Bits 23:17 **JEDEC CODE[6:0]**: JEDEC code
 0x3B: Arm®

Bit 16 **MEMAP**: Memory access port
 1: Standard register map

Bits 15:8 Reserved, must be kept at reset value.

Bits 7:0 **IDENTITY[7:0]**: AP type identification
 0x01: AHB-AP (AP0 and AP1)
 0x02: APB-AP (AP2)
 0x11: Reserved

60.5 Trace and debug subsystem functional description

The trace and debug subsystem features the following CoreSight components:

- System ROM tables
- Global timestamp generator (TSG)
- System cross-trigger interface (CTI)
- Cross-trigger matrix (CTM)
- Trace port interface unit (TPIU)
- Trace bus funnel (CSTF)
- Embedded trace FIFO (ETF)
- Serial wire output (SWO)
- Serial wire output trace funnel (SWTF)

These components are accessible by the debugger via the system APB-AP and its associated APB-D debug bus. They are also accessible by the Cortex-M7 processor.

The MCU debug unit (DBGMCU) is also accessed via the APB-D. This non-CoreSight component contains registers for configuring the device behavior in Debug mode.

Trace bus replicator branches the trace bus from the CPU's ITM CoreSight component to ETF and SWO, through trace bus funnels.

60.5.1 System ROM tables

There are two ROM tables on the APB-D bus. The ROM table is a CoreSight component that contains the base addresses of all the CoreSight components on the APB-D bus. These tables allow a debugger to access the topology of the CoreSight components automatically.

The first table points to the second table, and to the CoreSight components located in D3 power domain: SWO, SWTF, TSG. The DBGMCU is not referenced by the table as it is not a standard CoreSight component. The table occupies a 4-Kbyte, 32-bit wide chunk of APB-D address space, from 0xE00E0000 to 0xE00E0FFC when accessed by the debugger, and from 0x5C000000 to 0x5C000FFC when accessed from the system bus.

Table 604. System ROM table 1

| Address offset in ROM table | Component name | Component base address (debugger) | Component base address (system bus) | Component address offset | Size | Entry |
|-----------------------------|---------------------|-----------------------------------|-------------------------------------|--------------------------|----------|------------|
| 0x000 | - | - | - | - | 4 Kbytes | 0x00001002 |
| 0x004 | - | - | - | - | 4 Kbytes | 0x00002002 |
| 0x008 | SWO | 0xE00E3000 | 0x5C003000 | 0x03000 | 4 Kbytes | 0x00003003 |
| 0x00C | SWO funnel | 0xE00E4000 | 0x5C004000 | 0x04000 | 4 Kbytes | 0x00004003 |
| 0x010 | Timestamp generator | 0xE00E5000 | 0x5C005000 | 0x05000 | 4 Kbytes | 0x00005003 |

Table 604. System ROM table 1 (continued)

| Address offset in ROM table | Component name | Component base address (debugger) | Component base address (system bus) | Component address offset | Size | Entry |
|-----------------------------|---------------------|-----------------------------------|-------------------------------------|--------------------------|----------|--|
| 0x014 | System ROM table 2 | 0xE00F0000 | 0x5C010000 | 0x10000 | 4 Kbytes | 0x00010003 |
| 0x018 | Top of table | - | - | - | - | 0x00000000 |
| 0x01C to 0xFC8 | Reserved | - | - | - | - | 0x00000000 |
| 0xFCC to 0xFFC | ROM table registers | - | - | - | - | See System ROM registers |

The second table occupies a 4-Kbyte, 32-bit wide chunk of APB-D address space, from 0xE00F0000 to 0xE00F0FFC when accessed by the debugger, and from 0x5C010000 to 0x5C010FFC when accessed from the system bus.

Table 605. System ROM table 2

| Address offset in ROM table | Component name | Component base address (debugger) | Component base address (system bus) | Component address offset | Size | Entry |
|-----------------------------|---------------------|-----------------------------------|-------------------------------------|--------------------------|----------|--|
| 0x000 | System CTI | 0xE00F1000 | 0x5C011000 | 0x1000 | 4 Kbytes | 0x00001003 |
| 0x004 | - | - | - | - | 4 Kbytes | 0x00002002 |
| 0x008 | Trace funnel | 0xE00F3000 | 0x5C013000 | 0x3000 | 4 Kbytes | 0x00003003 |
| 0x00C | ETF | 0xE00F4000 | 0x5C014000 | 0x4000 | 4 Kbytes | 0x00004003 |
| 0x010 | TPIU | 0xE00F5000 | 0x5C015000 | 0x5000 | 4 Kbytes | 0x00005003 |
| 0x014 | - | - | - | - | 4 Kbytes | 0x00006002 |
| 0x018 | - | - | - | - | 4 Kbytes | 0x00007002 |
| 0x01C | - | - | - | - | 4 Kbytes | 0x00008002 |
| 0x020 | Top of table | - | - | - | - | 0x00000000 |
| 0x024 to 0xFC8 | Reserved | - | - | - | - | 0x00000000 |
| 0xFCC to 0xFFC | ROM table registers | - | - | - | - | See System ROM registers |

The top of each ROM table contains a number of read-only registers, including the standard CoreSight component and peripheral identity registers, see section [System ROM registers](#).

Each debug component occupies one or more 4 Kbyte blocks of address space. This block of address space is referred to as the debug register file for the component.

The component address offset field of a ROM Table entry points to the start of the last 4 Kbyte block of the address space of the component. This block always contains the component and peripheral ID registers for the component, starting at offset 0xFD0 from the start of the block. The 4 Kbyte count field PIDR4 [7:4], specifies the number of 4 Kbyte blocks for the component. Therefore, the process for finding the start of the address space for a component is:

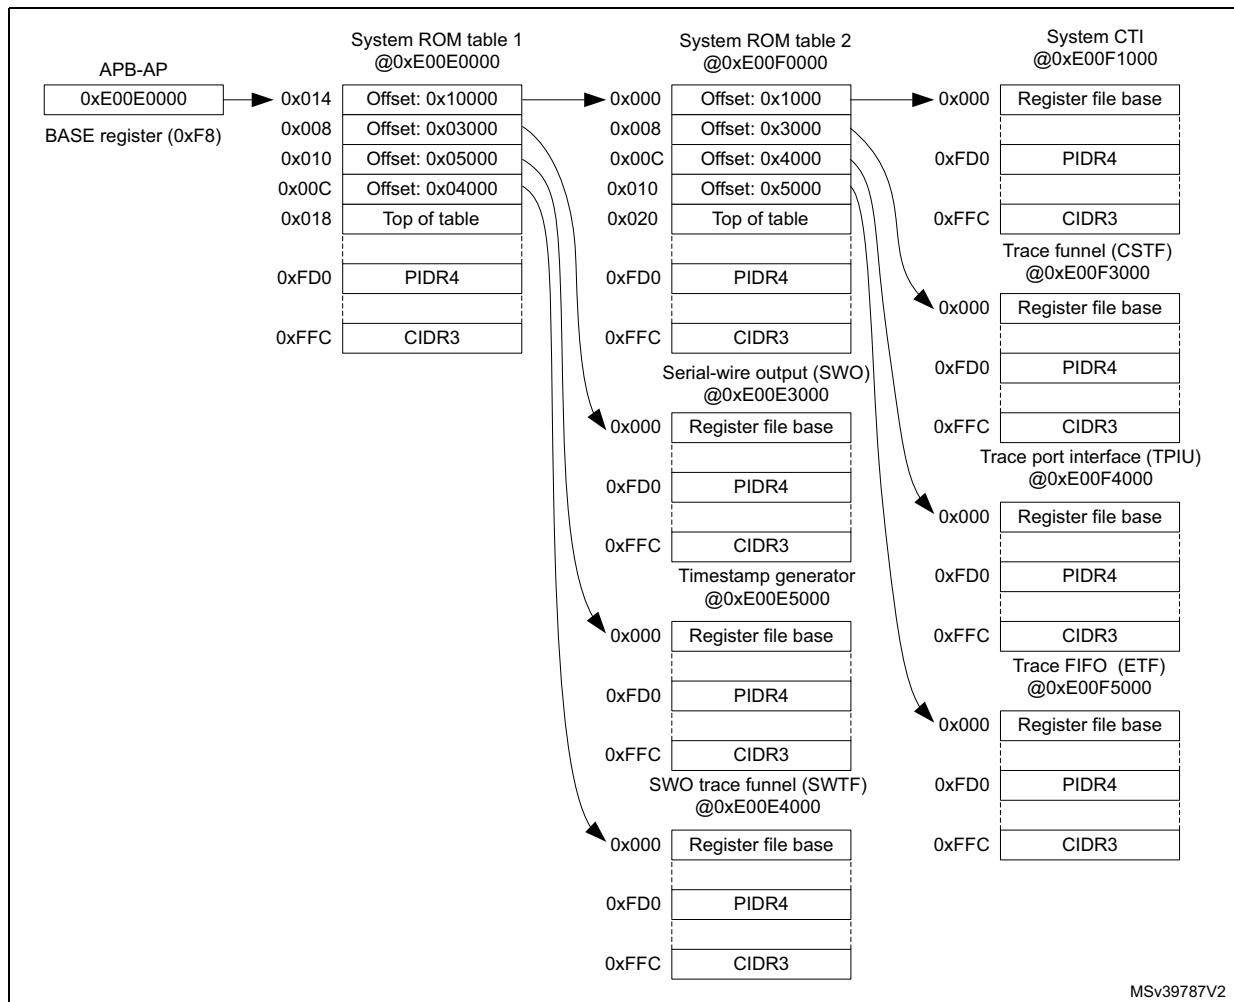

1. Read the ROM-table entry for the component and extract its Address_Offset[18:0] from bits [31:12] of the ROM-table entry.
2. Use the address offset, together with the base address of the ROM table, ROM_Base_Address, to calculate the base address of the component:

$$\text{Component_Base_Address} = \text{ROM_Base_Address} + \text{Address_Offset}$$
 The Component_Base_Address is the start address of the 4 Kbyte block of the address space for the component.
3. Read the peripheral ID4 register for the component. The address of this register is:

$$\text{Peripheral_ID4_address} = \text{Component_Base_Address} + 0xFD0$$
4. Extract the 4 Kbyte count field [7:4] from the value of the Peripheral ID4 Register.
5. Use the 4 Kbyte count field value to calculate the start address of the address space for the component. If the field value is 0b0000, which corresponds to a count value of 1, the address space for the component starts at Component_Base_Address obtained at stage 2.

The topology for the CoreSight components on the APB-D is shown in [Figure 833](#).

Figure 833. APB-D CoreSight component topology

For more information on the use of the ROM table, refer to the Arm® Debug Interface Architecture Specification [1].

System ROM registers

60.5.2 Global timestamp generator (TSG)

The global timestamp generator contains a 64-bit counter that provides a common timing reference for all of the trace sources in the system, namely the ETM and ITM in the processor core. These components insert timestamps in the trace streams that allow the trace analyzer to recover the chronological order of trace packets, which can be lost when multiple trace sources are multiplexed into one stream at the funnels.

The TSG registers are accessible over the APB-D. This allows the debugger or debug software to:

- start and stop the timestamp incrementing
- read the current timestamp value
- change the current timestamp value
 - The timestamp counter must be halted while it is changed. When the timestamp value is changed, the timestamp generator resynchronizes all the trace sources.
- change the reported timestamp increment

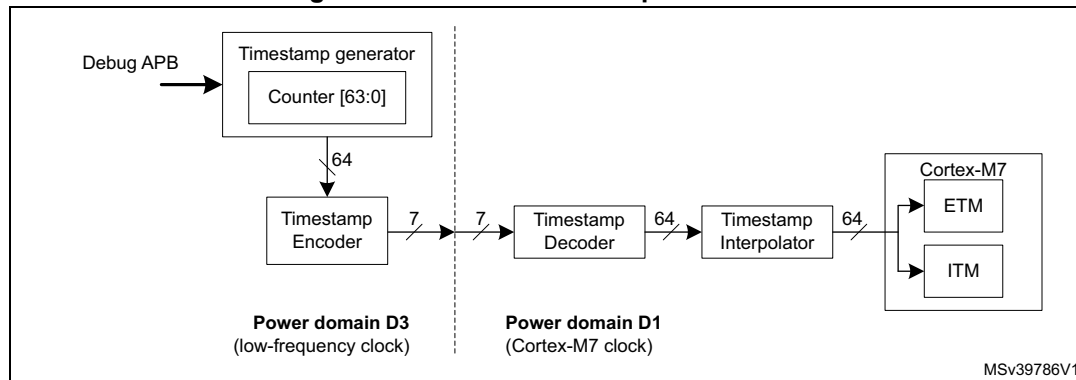

For more information on the global timestamp generator CoreSight component, refer to the Arm® CoreSight™ SoC-400 Technical Reference Manual [2].

The timestamp generator is located in the D3 power domain, and the timestamp is distributed to the Cortex-M7. To simplify the distribution over power domain boundaries, the

64-bit timestamp is encoded in seven bits, then decoded in the destination power domain, and interpolated to increase its resolution if the processor clock is significantly faster than the generator clock. The timestamp distribution is shown in [Figure 834](#).

Figure 834. Global timestamp distribution

TSG registers

TSG counter control register (TSG_CNTCR)

| | | | | | | | | | | | | | | r | |

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **DBGH**: Debug halt

0: Normal operation

1: Counter halted due to system-wide debug state

Bit 0 Reserved, must be kept at reset value.

TSG current counter value lower register (TSG_CNTCVL)

Address offset: 0x008

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|---------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| CNTCVL[31:16] | | | | | | | | | | | | | | | |
| r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w |

| CNTCVL[15:0] | | | | | | | | | | | | | | | |
| r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w |

Bits 31:0 **CNTCVL[31:0]**: TSG current counter value field, bits[31:0]

To change the current timestamp value, write the lower 32 bits of the new value to this register before writing the upper 32 bits to CNTCVU. The timestamp value is not changed until the CNTVCVU register is written to. Note: The TSG_CNTCR register's EN bit must be cleared before writing to this register.

TSG current counter value upper register (TSG_CNTCVU)

Address offset: 0x00C

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|---------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| CNTCVU[31:16] | | | | | | | | | | | | | | | |
| r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| CNTCVU[15:0] | | | | | | | | | | | | | | | |

Bits 31:0 **CNTCVU[31:0]**: TSG current counter value field, bits[63:32]

To change the current timestamp value, write the lower 32 bits of the new value to CNTCVL before writing the upper 32 bits to this register. The 64-bit timestamp value is updated with the value from both writes when this register is written to. Note: The TSG_CNTCR register's EN bit must be cleared before writing to this register.

TSG base frequency ID register (TSG_CNTFID0)

Address offset: 0x020

Reset value: 0x0000 0000

60.5.3 Cross trigger interfaces (CTI) and matrix (CTM)

The cross trigger interfaces (CTI) and cross trigger matrix (CTM) together form the CoreSight embedded cross trigger feature. There are two CTI components, one at system

level and one dedicated to the Cortex-M7. The two CTIs are connected to each other via the CTM. The system-level CTI is accessible to the debugger via the system access port and associated APB-D. The Cortex-M7 CTI is physically integrated in the Cortex-M7 core, and is accessible via the Cortex-M7 access port and associated AHBD.

Figure 835. Embedded cross trigger

The CTIs allow events from various sources to trigger debug and/or trace activity. For example, a transition detected on an external trigger input can start code trace.

Each CTI has up to 8 trigger inputs and 8 trigger outputs. Any input can be connected to any output, on the same CTI, or on another CTI via the CTM.

The trigger input and output signals for each CTI are listed in [Table 609](#) to [Table 612](#).

Table 609. System CTI inputs

| # | Source signal | Source component | Comments |
|---|---------------|------------------|--|
| 0 | DBTRIGI | GPIO | External trigger input - allows an external signal to generate a debug event |
| 1 | ETFACQCOMP | ETF | ETF capture finished - allows a debug event to be generated when the trace FIFO is empty |

Table 609. System CTI inputs (continued)

| # | Source signal | Source component | Comments |
|---|---------------|------------------|--|
| 2 | ETFFULL | ETF | ETF full flag - allows a debug event to be generated when the trace FIFO is full |
| 3 | - | - | Not used |
| 4 | - | - | Not used |
| 5 | - | - | Not used |
| 6 | - | - | Not used |
| 7 | - | - | Not used |

Table 610. System CTI outputs

| # | Output signal | Destination component | Comments |
|---|---------------|-----------------------|--|
| 0 | DBTRIGO | GPIO | External IO trigger output - allows monitoring of events on the external DBTRIGO pin |
| 1 | TPIUFLUSH | TPIU | Trace port flush trigger - causes the TPIU FIFO to be flushed |
| 2 | TPIUTRIG | TPIU | Trace Port enable trigger - starts trace output on the external trace port |
| 3 | ETFTRIG | ETF | ETF enable trigger - starts filling the Trace FIFO |
| 4 | ETFFLUSH | ETF | ETF flush trigger - causes the Trace FIFO to be flushed |
| 5 | - | - | Not used |
| 6 | - | - | Not used |
| 7 | - | - | Not used |

Table 611. Cortex-M7 CTI inputs

| # | Source signal | Source component | Comments |
|---|---------------|------------------|---|
| 0 | HALTED | Cortex-M7 CPU | CPU halted - indicates CPU is in Debug mode |
| 1 | COMPMATCH0 | Cortex-M7 DWT | DWT comparator 0 match |
| 2 | COMPMATCH1 | Cortex-M7 DWT | DWT comparator 1 match |
| 3 | COMPMATCH2 | Cortex-M7 DWT | DWT comparator 2 match |
| 4 | ETMEXTOUT0 | Cortex-M7 ETM | ETM external trigger out |
| 5 | ETMEXTOUT1 | Cortex-M7 ETM | ETM external trigger out |
| 6 | - | - | Not used |
| 7 | - | - | Not used |

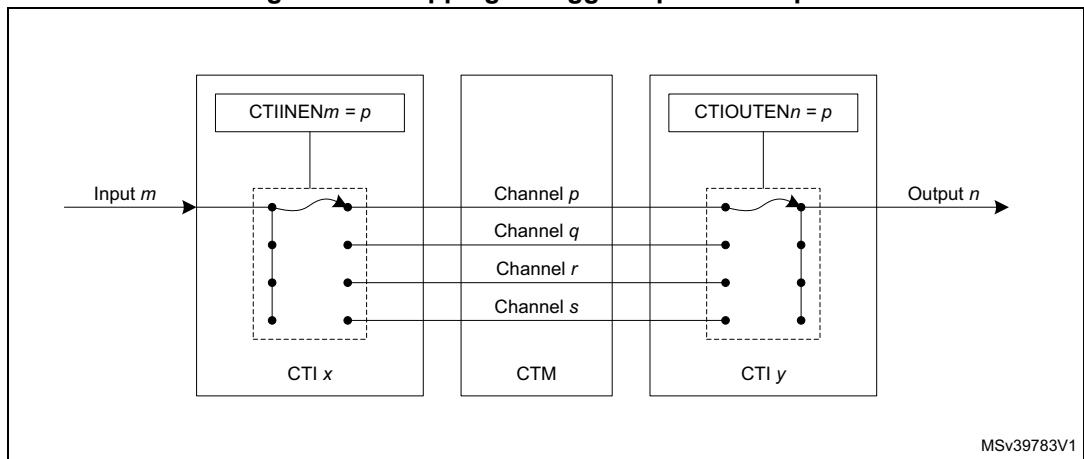

Table 612. Cortex-M7 CTI outputs

| # | Output signal | Destination component | Comments |
|---|---------------|-----------------------|--|
| 0 | EDBGRRQ | Cortex-M7 CPU | CPU halt request - puts CPU in Debug mode |
| 1 | nIRQ1 | Cortex-M7 NVIC | Interrupt request |
| 2 | nIRQ2 | Cortex-M7 NVIC | Interrupt request |
| 3 | - | - | Not used |
| 4 | ETMEVENTS0 | Cortex-M7 ETM | ETM trig request - enables CPU execution trace |
| 5 | ETMEVENTS1 | Cortex-M7 ETM | ETM trig request - enables CPU execution trace |
| 6 | - | - | Not used |
| 7 | DBGRESTART | Cortex-M7 CPU | CPU restart request - CPU exits Debug mode |

There are four event channels in the cross trigger matrix, which allows up to four parallel bidirectional connections between trigger inputs and outputs on different CTIs. To connect input number m on CTI x to output number n on CTI y , the input must be connected to an event channel p using the CTIINEN m register of CTI x . The same channel p must be connected to the output using the CTIOUTEN n register of CTI y . Note: this applies even if the input and output belong to the same CTI.

An input can be connected to more than one channel (up to four), so an input can be routed to several outputs. Similarly, an output can be connected to several inputs. It is also possible to connect several inputs/outputs to the same channel.

Figure 836. Mapping of trigger inputs to outputs

For more information on the cross-trigger interface CoreSight component, refer to the Arm[®] CoreSight[™] SoC-400 Technical Reference Manual [2].

CTI registers

The register file base address for each CTI is defined by the ROM table for the bus to which it is connected. The registers are the same for each CTI.

CTI control register (CTI_CONTROL)

Address offset: 0x000

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|-------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | GLBEN |
| | | | | | | | | | | | | | | | rw |

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **GLBEN**: Global enable.

0: Cross-triggering disabled

1: Cross-triggering enabled

CTI trigger acknowledge register (CTI_INTACK)

Address offset: 0x010

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|-------------|------|------|------|------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | INTACK[7:0] | | | | | | | |
| | | | | | | | | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **INTACK[7:0]**: Trigger acknowledge

There is one bit of the register for each CTITRIGOUT output. When a 1 is written to a bit in this register, the corresponding CTITRIGOUT output is acknowledged, causing it to be cleared.

CTI application trigger set register (CTI_APPSET)

Address offset: 0x014

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|------|------|------|------|-------------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | APPSET[3:0] | | | |
| | | | | | | | | | | | | rw | rw | rw | rw |

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **APPSET[3:0]**: Set channel event

Read:

- 0bXXX0: Channel 0 event inactive
- 0bXXX1: Channel 0 event active
- 0bXX0X: Channel 1 event inactive
- 0bXX1X: Channel 1 event active
- 0bX0XX: Channel 2 event inactive
- 0bX1XX: Channel 2 event active
- 0b0XXX: Channel 3 event inactive
- 0b1XXX: Channel 3 event active

Write:

- 0bXXX0: No effect
- 0bXXX1: Set event on Channel 0
- 0bXX0X: No effect
- 0bXX1X: Set event on Channel 1
- 0bX0XX: No effect
- 0bX1XX: Set event on Channel 2
- 0b0XXX: No effect
- 0b1XXX: Set event on Channel 3

CTI application trigger clear register (CTI_APPCLEAR)

Address offset: 0x018

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|------|------|------|------|---------------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | APPCLEAR[3:0] | | | |
| | | | | | | | | | | | | w | w | w | w |

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **APPCLEAR[3:0]**: Clear channel event

- 0bXXX0: No effect
- 0bXXX1: Clear event on Channel 0
- 0bXX0X: No effect
- 0bXX1X: Clear event on Channel 1
- 0bX0XX: No effect
- 0bX1XX: Clear event on Channel 2
- 0b0XXX: No effect
- 0b1XXX: Clear event on Channel 3

CTI application pulse register (CTI_APPPULSE)

Address offset: 0x01C

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|------|------|------|------|---------------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | APPPULSE[3:0] | | | |
| | | | | | | | | | | | | w | w | w | w |

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **APPPULSE[3:0]**: Pulse channel event

This register clears itself immediately.

- 0bXXX0: No effect
- 0bXXX1: Generate pulse on Channel 0
- 0bXX0X: No effect
- 0bXX1X: Generate pulse on Channel 1
- 0bX0XX: No effect
- 0bX1XX: Generate pulse on Channel 2
- 0b0XXX: No effect
- 0b1XXX: Generate pulse on Channel 3

CTI trigger IN x enable register (CTI_INENx)

Address offset: 0x020 + 4 * x, where x = 0 to 7

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|------|------|------|------|---------------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | TRIGINEN[3:0] | | | |
| | | | | | | | | | | | | r/w | r/w | r/w | r/w |

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **TRIGINEN[3:0]**: Cross-trigger event enable

Enables or disables a cross-trigger event on each of the four channels when CTITRIGIN_x is activated (x = 0 to 7).

- 0bXXX0: Trigger n does not generate events on Channel 0
- 0bXXX1: Trigger n generates events on Channel 0
- 0bXX0X: Trigger n does not generate events on Channel 1
- 0bXX1X: Trigger n generates events on Channel 1
- 0bX0XX: Trigger n does not generate events on Channel 2
- 0bX1XX: Trigger n generates events on Channel 2
- 0b0XXX: Trigger n does not generate events on Channel 3
- 0b1XXX: Trigger n generates events on Channel 3

CTI trigger OUT x enable register (CTI_OUTEN_x)

Address offset: 0x0A0 + 4 * x, where x = 0 to 7

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|------|------|------|------|----------------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | TRIGOUTEN[3:0] | | | |
| | | | | | | | | | | | | r/w | r/w | r/w | r/w |

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **TRIGOUTEN[3:0]**: Enable trigger upon event

For each channel, the field defines whether an event on that channel will generate a trigger on CTITRIGOUT_x (x = 0 to 7).

- 0bXXX0: Channel 0 events do not generate triggers on Trigger output n
- 0bXXX1: Channel 0 events generate triggers on Trigger output n
- 0bXX0X: Channel 1 events do not generate triggers on Trigger output n
- 0bXX1X: Channel 1 events generate triggers on Trigger output n
- 0bX0XX: Channel 2 events do not generate triggers on Trigger output n
- 0bX1XX: Channel 2 events generate triggers on Trigger output n
- 0b0XXX: Channel 3 events do not generate triggers on Trigger output n
- 0b1XXX: Channel 3 events generate triggers on Trigger output n

CTI trigger IN status register (CTI_TRGISTS)

Address offset: 0x130

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|-------------------|------|------|------|------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | TRIGINSTATUS[7:0] | | | | | | | |
| | | | | | | | | r | r | r | r | r | r | r | r |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **TRIGINSTATUS[7:0]**: Trigger input status

There is one bit of the register for each CTITRIGIN input. When a bit is set to 1 it indicates that the corresponding trigger input is active. When it is set to 0, the corresponding trigger input is inactive.

CTI trigger OUT status register (CTI_TRGOSTS)

Address offset: 0x134

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|--------------------|------|------|------|------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | TRIGOUTSTATUS[7:0] | | | | | | | |
| | | | | | | | | r | r | r | r | r | r | r | r |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **TRIGOUTSTATUS[7:0]**: Trigger output status

There is one bit of the register for each CTITRIGOUT output. When a bit is set to 1 it indicates that the corresponding trigger output is active. When it is set to 0, the corresponding trigger output is inactive.

CTI channel IN status register (CTI_CHINSTS)

Address offset: 0x138

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|------|------|------|------|-----------------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | CHINSTATUS[3:0] | | | |
| | | | | | | | | | | | | r | r | r | r |

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CHINSTATUS[3:0]**: Channel input status

There is one bit of the register for each channel input. When a bit is set to 1 it indicates that the corresponding channel input is active. When it is set to 0, the corresponding channel input is inactive.

CTI channel OUT status register (CTI_CHOUTSTS)

Address offset: 0x13C

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|------|------|------|------|------------------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | CHOUTSTATUS[3:0] | | | |
| | | | | | | | | | | | | r | r | r | r |

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CHOUTSTATUS[3:0]**: Channel output status

There is one bit of the register for each channel output. When a bit is set to 1 it indicates that the corresponding channel output is active. When it is set to 0, the corresponding channel output is inactive.

CTI channel gate register (CTI_GATE)

Address offset: 0x140

Reset value: 0x0000 000F

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|------|------|------|------|-------------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | GATEEN[3:0] | | | |
| | | | | | | | | | | | | rw | rw | rw | rw |

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **GATEEN[3:0]**: Channel output enable

For each channel, defines whether an event on that channel can propagate over the CTM to other CTIs.

- 0bXXX0: Channel 0 events do not propagate
- 0bXXX1: Channel 0 events propagate
- 0bXX0X: Channel 1 events do not propagate
- 0bXX1X: Channel 1 events propagate
- 0bX0XX: Channel 2 events do not propagate
- 0bX1XX: Channel 2 events propagate
- 0b0XXX: Channel 3 events do not propagate
- 0b1XXX: Channel 3 events propagate

CTI claim tag set register (CTI_CLAIMSET)

Address offset: 0xFA0

Reset value: 0x0000 000F

| | | | | | | | | | | | | rw | rw | rw | rw |

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CLAIMSET[3:0]**: Set claim tag bits

Write:
 0000: No effect
 xxx1: Set bit 0
 xx1x: Set bit 1
 x1xx: Set bit 2
 1xxx: Set bit 3

Read:
 0xF: Indicates there are four bits in claim tag

CTI claim tag clear register (CTI_CLAIMCLR)

Address offset: 0xFA4

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|------|------|------|------|---------------|------|------|------|

| | | | | | | | | | | | | rw | rw | rw | rw |

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CLAIMCLR[3:0]**: Reset claim tag bits

Write:
 0000: No effect
 xxx1: Clear bit 0
 xx1x: Clear bit 1
 x1xx: Clear bit 2
 1xxx: Clear bit 3

Read: Returns current value of claim tag

CTI lock access register (CTI_LAR)

Address offset: 0xFB0

Reset value: N/A

| | | | | | | | | | | | | | | | |
|-----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| ACCESS_W[31:16] | | | | | | | | | | | | | | | |
| w | w | w | w | w | w | w | w | w | w | w | w | w | w | w | w |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| ACCESS_W[15:0] | | | | | | | | | | | | | | | |
| w | w | w | w | w | w | w | w | w | w | w | w | w | w | w | w |

Bits 31:0 **ACCESS_W[31:0]**: CTI register write access enable

Enables write access to some CTI registers by processor core (debuggers do not need to unlock the component)

0xC5ACCE55: Enable write access

Other values: Disable write access

CTI lock status register (CTI_LSR)

Address offset: 0xFB4

Reset value: 0x0000 0003

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|------|------|------|------|------|----------|-----------|-----------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | LOCKTYPE | LOCKGRANT | LOCKEXIST |
| | | | | | | | | | | | | | r | r | r |

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **LOCKTYPE**: Size of the CTI_LAR register

0: 32-bit

Bit 1 **LOCKGRANT**: Current status of lock

This bit always returns zero when read by an external debugger.

0: Write access is permitted

1: Write access is blocked. Only read access is permitted.

Bit 0 **LOCKEXIST**: Existence of lock control mechanism

The bit indicates whether a lock control mechanism exists. It always returns zero when read by an external debugger.

0: No lock control mechanism exists

1: Lock control mechanism is implemented

CTI authentication status register (CTI_AUTHSTAT)

Address offset: 0xFB8

Reset value: 0x0000 000A

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|-----------|------|----------|------|------------|------|-----------|------|

| | | | | | | | | r | r | r | r | r | r | r | r |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:6 **SNID[1:0]**: Security level for secure non-invasive debug
 0x0: Not implemented

Bits 5:4 **SID[1:0]**: Security level for secure invasive debug
 0x0: Not implemented

Bits 3:2 **NSNID[1:0]**: Security level for non-secure non-invasive debug
 0x2: Disabled
 0x3: Enabled

Bits 1:0 **NSID[1:0]**: Security level for non-secure invasive debug
 0x2: Disabled
 0x3: Enabled

CTI device configuration register (CTI_DEVID)

Address offset: 0xFC8

Reset value: 0x0004 0800

| | | | | | | | | | | | | | | | |
|--------------|------|------|------|------|------|------|------|------|------|------|----------------|------------|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| r | r | r | r | r | r | r | r | | | | r | r | r | r | r |

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:16 **NUMCH[3:0]**: Number of ECT channels available
 0x4: 4 channels

Bits 15:8 **NUMTRIG[7:0]**: Number of ECT triggers available
 0x8: 8 trigger inputs and 8 trigger outputs

Bits 7:5 Reserved, must be kept at reset value.

Bits 4:0 **EXTMUXNUM[4:0]**: Number of trigger input/output multiplexers
 0x0: None

CTI device type identifier register (CTI_DEVTYPE)

Address offset: 0xFCC

Reset value: 0x0000 0014

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|--------------|------|------|------|----------------|------|------|------|

| | | | | | | | | r | r | r | r | r | r | r | r |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **SUBTYPE[3:0]**: Sub-classification

0x1: Indicates that this component is a cross-triggering component.

Bits 3:0 **MAJORTYPE[3:0]**: Major classification

0x4: Indicates that this component allows a debugger to control other components in a CoreSight SoC-400 system.

CTI CoreSight peripheral identity register 4 (CTI_PIDR4)

Address offset: 0xFD0

Reset value: 0x0000 0004

| | | | | | | | | r | r | r | r | r | r | r | r |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **4KCOUNT[3:0]**: Register file size

0x0: Register file occupies a single 4 Kbyte region

Bits 3:0 **JEP106CON[3:0]**: JEP106 continuation code

0x4: Arm® JEDEC code

CTI CoreSight peripheral identity register 0 (CTI_PIDR0)

Address offset: 0xFE0

Reset value: 0x0000 0006

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|--------------|------|------|------|------|------|------|------|

60.5.4 Trace funnel (CSTF)

The trace funnel is a CoreSight component that combines the ATB buses from two trace sources into one single ATB. The CSTF has two ATB slave ports, and one ATB master port. An arbiter selects the slave ports according to a programmable priority.

The slave ports are connected as follows:

- S0: Cortex-M7 ETM
- S1: Cortex-M7 ITM

The CSTF registers allow the slave ports to be individually enabled, and their priority settings to be configured. The priorities can be modified only when trace is disabled. The arbitration works as follows:

- The arbiter selects the slave port with the highest assigned priority that has data valid
- Up to *min_hold_time* transfers are passed from the selected slave to the master port, where *min_hold_time* is programmable in the CONTROL register.
- A new arbitration is then performed

High priority should be assigned to slave ports connected to sources with a small amount of buffering, or where data loss can not be tolerated. Low priority should be assigned to less critical sources or those with large buffers.

For more information on the ATB Funnel CoreSight component, refer to the Arm® CoreSight™ SoC-400 Technical Reference Manual [2].

Trace funnel registers

CSTF control register (CSTF_CTRL)

Address offset: 0x000

Reset value: 0x0000 0300

| | | | | | | | | | | | | | | | |
|------|------|------|------|--------------------|------|------|------|------|------|------|------|------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |

| Res. | Res. | Res. | Res. | MIN_HOLD_TIME[3:0] | | | | Res. | Res. | Res. | Res. | Res. | Res. | ENS1 | ENS0 |
| | | | | rw | rw | rw | rw | | | | | | | rw | rw |

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:8 **MIN_HOLD_TIME[3:0]**: Number of transactions between arbitrations.

- 0x0: 1 transaction
- :
- 0xE: 15 transactions
- 0xF: Reserved

Bits 7:2 Reserved, must be kept at reset value.

Bit 1 **ENS1**: S1 slave port enable

0: Disable port

1: Enable port

Bit 0 **ENS0**: S0 slave port enable

0: Disable port

1: Enable port

CSTF priority register (CSTF_PRIORITY)

Address offset: 0x004

Reset value: 0x0000 0688

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|------|------|---------------|------|------|---------------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |

| | | | | | | | | | | rW | rW | rW | rW | rW | rW |

Bits 31:6 Reserved, must be kept at reset value.

Bits 5:3 **PRIPORT1[2:0]**: S1 slave port priority

0: Highest priority

:

7: Lowest priority

Bits 2:0 **PRIPORT0[2:0]**: S0 slave port priority

0: Highest priority

:

7: Lowest priority

CSTF claim tag set register (CSTF_CLAIMSET)

Address offset: 0xFA0

Reset value: 0x0000 000F

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|------|------|------|------|---------------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | CLAIMSET[3:0] | | | |
| | | | | | | | | | | | | rW | rW | rW | rW |

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CLAIMSET[3:0]**: Set claim tag bits

Write:
 0000: No effect
 xxx1: Set bit 0
 xx1x: Set bit 1
 x1xx: Set bit 2
 1xxx: Set bit 3

Read:
 0xF: Indicates there are four bits in claim tag

CSTF claim tag clear register (CSTF_CLAIMCLR)

Address offset: 0xFA4
 Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|------|------|------|------|---------------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | CLAIMCLR[3:0] | | | |
| | | | | | | | | | | | | rw | rw | rw | rw |

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CLAIMCLR[3:0]**: Reset claim tag bits

Write:
 0000: No effect
 xxx1: Clear bit 0
 xx1x: Clear bit 1
 x1xx: Clear bit 2
 1xxx: Clear bit 3

Read: Returns current value of claim tag

CSTF lock access register (CSTF_LAR)

Address offset: 0xFB0
 Reset value: N/A

| | | | | | | | | | | | | | | | |
|-----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| ACCESS_W[31:16] | | | | | | | | | | | | | | | |
| w | w | w | w | w | w | w | w | w | w | w | w | w | w | w | w |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| ACCESS_W[15:0] | | | | | | | | | | | | | | | |
| w | w | w | w | w | w | w | w | w | w | w | w | w | w | w | w |

Bits 31:0 **ACCESS_WJ[31:0]**: CSTF register write access enable

The field enables write access to some CSTF registers by processor cores (debuggers do not need to unlock the component).

0xC5ACCE55: Enable write access

Other values: Disable write access

CSTF lock status register (CSTF_LSR)

Address offset: 0xFB4

Reset value: 0x0000 0003

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|------|------|------|------|------|--------------|---------------|---------------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | LOCKT YPE | LOCKG RANT | LOCKE XIST |
| | | | | | | | | | | | | | r | r | r |

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **LOCKTYPE**: Size of the CSTF_LAR register

0: 32-bit

Bit 1 **LOCKGRANT**: Current status of lock

This bit always returns zero when read by an external debugger.

0: Write access is permitted

1: Write access is blocked. Only read access is permitted.

Bit 0 **LOCKEXIST**: Existence of lock control mechanism

The bit indicates whether a lock control mechanism exists. It always returns zero when read by an external debugger.

0: No lock control mechanism exists

1: Lock control mechanism is implemented

CSTF authentication status register (CSTF_AUTHSTAT)

Address offset: 0xFB8

Reset value: 0x0000 000A

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|-----------|------|----------|------|------------|------|-----------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | SNID[1:0] | | SID[1:0] | | NSNID[1:0] | | NSID[1:0] | |
| | | | | | | | | r | r | r | r | r | r | r | r |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:6 **SNID[1:0]**: Security level for secure non-invasive debug
 0x0: Not implemented

Bits 5:4 **SID[1:0]**: Security level for secure invasive debug
 0x0: Not implemented

Bits 3:2 **NSNID[1:0]**: Security level for non-secure non-invasive debug
 0x2: Disabled
 0x3: Enabled

Bits 1:0 **NSID[1:0]**: Security level for non-secure invasive debug
 0x2: Disabled
 0x3: Enabled

CSTF CoreSight device identity register (CSTF_DEVID)

Address offset: 0xFC8

Reset value: 0x0000 0024

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|-------------|------|------|------|--------------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

60.5.5 Embedded trace FIFO (ETF)

The ETF is a 4 Kbyte memory that captures trace data from two trace sources, namely the ETM and ITM of the CPU core. The ETF is a design configuration of the CoreSight™ trace memory controller component.

The ETF can be used in three modes (selected in the mode register):

1. Hardware FIFO mode

The trace memory is used as a FIFO that is drained through the ATB master interface. Trace data is captured into the trace RAM and when full, the incoming trace stream is stalled. When the Trace buffer is not empty, trace data is drained out through the ATB master interface to the TPIU.

In this mode, the role of the FIFO is to smooth the flow of trace information arriving at the trace port. Since the trace data can be very irregular by nature, the peak data rate can easily exceed the port capability, resulting in an overflow. The ETF allows a steady data rate at the trace port, which can then be sized according to the average rate rather

than the peak. The trace is stored off-chip in real time by the trace port analyzer tool, and so the trace log can be very big.

2. Software FIFO mode

The trace memory is used as a FIFO that can be read through the RRD Register while trace is being captured. Trace data is captured into the trace RAM and when full, the incoming trace stream is stalled.

This mode allows the trace to be transferred by DMA into the system memory, or to a high speed interface (such as SPI or USB), or even monitored by software. Note that unlike the hardware FIFO mode, this mode is invasive, since it uses system resources which are shared by the processor.

3. Circular buffer mode

The trace memory is used as a circular buffer. Trace data is captured into the Trace memory starting from the location pointed to by the write pointer register. Even when the trace memory is full, incoming trace data continues to be overwritten to the trace memory until a stop condition occurs.

In this mode, the ETF stores the trace data on-chip, so the trace log size is limited to that of the ETF SRAM, 4 Kbytes in this case. Being a circular buffer, when the FIFO becomes full, incoming trace data overwrites the oldest stored data and the oldest stored data is lost. Therefore the content of the trace buffer represents the most recent activity of the processor, before the buffer was stopped, rather than all the activity since the trace was started.

There are three possible methods to read out the buffer contents once the trace stops:

- via the Trace port - with the TPIU enabled, the content of the buffer is output over the Trace port. This can be done by setting the DRAINBUF bit in the ETF_FFCR register.
- via the Debug port - the debugger can read the buffer via the RRD register that is accessible over the system APB-D.
- by software - the processor can read the buffer via the RRD register, since the APB-D is accessible from the system bus.

The ETF can be moved to any one of the following states:

- **Disabled**

This state is entered after a reset, or when trace capture is disabled. The ETF must only be programmed in this state.

- **Running**

Trace capture is performed in this state. It is entered by enabling trace capture while in disabled state.

- **Stopped**

Trace capture is stopped in this state, but the contents of the buffer can be read out or drained. This state is entered after a stop event (trigger or flush).

- **Disabling**

This is a transition state while disabling trace capture.

- **Stopping**

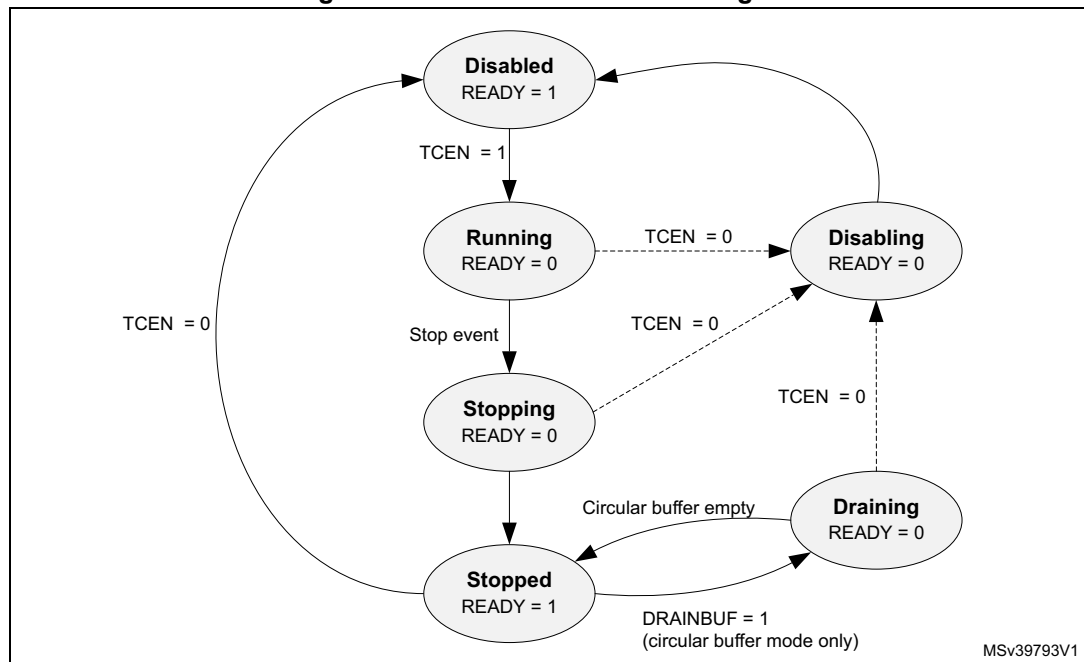

This is a transition state while stopping trace capture.

- **Draining**

This state is entered while draining the buffer in Stopped state.

The state transition diagram is shown in [Figure 837](#).

Figure 837. ETF state transition diagram

For more information on the CoreSight™ trace memory controller component, refer to the Arm® CoreSight™ trace memory controller technical reference manual [3].

ETF registers

ETF RAM size register (ETF_RSZ)

Address offset: 0x004

Reset value: 0x0000 0400

| | | | | | | | | | | | | | | | |
|-----------|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | RSZ[30:16] | | | | | | | | | | | | | | |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RSZ[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bit 31 Reserved, must be kept at reset value.

Bits 30:0 **RSZ[30:0]**: RAM size

The value of the field indicates the number of 32-bit words

0x400: 1024 words = 4 Kbytes

ETF status register (ETF_STS)

Address offset: 0x00C

Reset value: 0x0000 001C

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|------|------|------|-------|--------|-------|-------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | EMPTY | FEMPTY | READY | TRIGD | FULL |
| | | | | | | | | | | | r | r | r | r | r |

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **EMPTY**: Trace FIFO empty

This bit is valid only when the TCEN bit of the ETF_CTL register is high. This bit reads as zero when TCEN is low.

0: Trace FIFO contains data

1: Trace FIFO is empty.

Note: Empty trace FIFO does not mean that the ETF pipeline is empty. The latter is indicated by the FEMPTY bit.

Bit 3 **FEMPTY**: Formatter empty

This bit is set when trace capture has stopped, and all internal pipelines and buffers have been drained. Unlike READY, it is not affected by buffer drains. The ACQCOMP output reflects the value of this bit.

Bit 2 **READY**: ETF ready

This bit is set when trace capture has stopped and all internal pipelines and buffers have been drained (Stopped or Disabled state)

Bit 1 **TRIGD**: Triggered

The Triggered bit is set when trace capture is in progress and the TMC has detected a Trigger Event. This bit is cleared when leaving Disabled state.

This bit is operational only in the Circular buffer mode. In all other modes, this bit is always low.

This bit does not indicate that a trigger has been embedded in the formatted output trace data from the TMC. Trigger indication on the output trace stream is determined by the programming of the Formatter and Flush Control Register, ETF_FFCR.

Bit 0 **FULL**: Trace buffer full

In circular buffer mode, this flag is set when the RAM write pointer wraps around the top of the buffer, and remains set until the TCEN bit of the ETF_CTL register is cleared and set.

In software and hardware FIFO modes, this flag indicates that the current space in the trace memory is less than or equal to the value programmed in the ETF_BUFWM Register, that is, Fill level >= MEM_SIZE - BUFWM.

This bit is cleared when leaving Disabled state. The FULL output reflects the value of this register bit.

ETF RAM read data register (ETF_RRD)

Address offset: 0x010

Reset value: Unknown

| | | | | | | | | | | | | | | | |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| RRD[31:16] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RRD[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:0 **RRD[31:0]**: RAM Read Data.

Circular buffer mode:

When in Stopped state and the buffer is not empty, reading this register returns the next word of data from the trace buffer. When the whole trace buffer has been read, the Empty bit in the ETF_STS Register is set, and subsequent reads return 0xFFFFFFFF. Reading this register when not in Stopped state returns 0xFFFFFFFF.

Software FIFO mode:

Reading this register returns data from the FIFO. If this register is read when the FIFO is empty, the data returned is 0xFFFFFFFF.

Hardware FIFO mode:

Reading this register returns 0xFFFFFFFF.

ETF RAM read pointer register (ETF_RRP)

Address offset: 0x014

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------|------|------|-----------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |

| | | | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w |

Bits 31:13 Reserved, must be kept at reset value.

Bits 12:0 **RRP[12:0]**: RAM Read Pointer

The RAM Read Pointer Register contains the value of the read pointer that is used to read entries from the trace memory over the APB interface via the ETF_RRD register. The pointer can be programmed with a byte address, 64-bit aligned (that is, bits 0 to 3 should be zero). The pointer is incremented by 8 each time a full 64-bit FIFO entry has been written. When the pointer reaches its maximum value, it wraps around.

This register can only be written to while in Disabled state. It can be read in Disabled state, in Stopped state in circular buffer mode and SW FIFO mode, and also in Running and Stopping states in SW FIFO mode.

ETF RAM write pointer register (ETF_RWP)

Address offset: 0x018

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------|------|------|-----------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| Res. | Res. | Res. | RWP[12:0] | | | | | | | | | | | | |
| | | | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w |

Bits 31:13 Reserved, must be kept at reset value.

Bits 12:0 **RWP[12:0]**: RAM write pointer

The RAM write pointer register contains the value of the write pointer that is used to write entries into the trace memory over the APB interface via the ETF_RWD register. The pointer can be programmed with a byte address, 64-bit aligned (that is, bits 0 to 3 should be zero). The pointer is incremented by 8 each time a full 64-bit FIFO entry has been read. When the pointer reaches its maximum value, it wraps around.

This register can only be written to while in Disabled state. It can be read in Disabled state, in Stopped state in circular buffer mode and SW FIFO mode, and also in Running and Stopping states in SW FIFO mode.

ETF trigger counter register (ETF_TRG)

Address offset: 0x01C

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|-----------|------|------|------|------|------|------|------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | TRG[10:0] | | | | | | | | | | |
| | | | | | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w |

Bits 31:11 Reserved, must be kept at reset value.

Bits 10:0 **TRG[10:0]**: Trigger counter

In Circular buffer mode, specifies the number of 32-bit words to capture in the trace RAM following the detection of either a rising edge on the TRIGIN input or a trigger packet in the incoming trace stream, ATID =7'h7D. On capturing the specified number of data words, a trigger event occurs. The effect of a trigger event on the ETF behavior is controlled by the FFCR Register.

The number of 32-bit words written into the trace RAM following the trigger is the value stored in this register, plus one. This register is ignored when the ETF is in Software FIFO mode or Hardware FIFO mode. When the trigger counter starts counting, any additional triggers, either on TRIGIN or in the incoming trace stream, are ignored until the counter reaches zero. When the trigger counter has reached zero, it remains at zero until it is re-programmed with a write to this register.

This register is cleared when READY goes high, so that the state of the counter when trace capture has stopped does not affect a subsequent trace capture session. Writing to this register when not in Disabled state results in unpredictable behavior.

A read access to this register is permitted at any time when in Disabled state, or in Circular buffer mode. A read access returns the current value of the trigger counter.

ETF control register (ETF_CTL)

Address offset: 0x020

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| | | | | | | | | | | | | | | | rw |

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **TCEN**: Trace capture enable

When writing:

0: Disable trace capture (moves from Running, Stopping or Stopped state into Disabling or Disabled state)

1: Enable trace capture (moves from Disabled state to Running state)

When reading, this bit is low when in Disabling or Disabled states, and high otherwise.

ETF RAM write data register (ETF_RWD)

Address offset: 0x024

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| RWD[31:16] | | | | | | | | | | | | | | | |
| w | w | w | w | w | w | w | w | w | w | w | w | w | w | w | w |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RWD[15:0] | | | | | | | | | | | | | | | |
| w | w | w | w | w | w | w | w | w | w | w | w | w | w | w | w |

Bits 31:0 **RWD[31:0]**: RAM write data

When in Disabled state, a write to this register stores data at the location pointed to by the RWP. Writes to this register when not in Disabled state are ignored. When a full memory width (64-bit) of data has been written, the data is written to memory and the RAM Write Pointer is incremented to the next memory word.

This register is used for test purposes.

ETF mode register (ETF_MODE)

Address offset: 0x028

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|-----------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |

| | | | | | | | | | | | | | | rw | rw |

Bits 31:2 Reserved, must be kept at reset value.

Bits 1:0 **MODE[1:0]**: Operation mode

00b: Circular buffer mode

In this mode, the trace memory is used as a circular buffer. Trace data is captured into the Trace memory starting from the location pointed to by the write pointer register. Even when the trace memory is full, incoming trace data continues to be overwritten into the trace memory until a stop condition has occurred.

01b: Software FIFO mode

In this mode, the trace memory is used as a FIFO that can be read through the RRD Register while trace is being captured. Trace data is captured into the trace RAM and when full, the incoming trace stream is stalled.

10b: Hardware FIFO mode

In this mode, the trace memory is used as a FIFO that is drained through the ATB master interface. Trace data is captured into the trace RAM and when full, the incoming trace stream is stalled. When the trace buffer is non-empty, trace data is drained out through the ATB master interface to the TPIU.

11b: Reserved

ETF latched buffer fill level register (ETF_LBUFLVL)

Address offset: 0x02C

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------|------|------|------|-----------------|------|------|------|------|------|------|------|------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:0 **LBUFLEVEL[11:0]**: Latched buffer fill level

Reading this register returns the maximum fill level of the trace memory in 32-bit words since this register was last read. Reading this register also results in its contents being updated to the current fill level.

When entering Disabled state, this register retains its last value. While in Disabled state, reads from this register do not affect its value. When exiting Disabled state, the LBUFLEVEL register is cleared.

This register is used for performance analysis of the trace system.

ETF current buffer fill level register (ETF_CBUFLVL)

Address offset: 0x030

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------|------|------|------|-----------------|------|------|------|------|------|------|------|------|------|------|------|

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:0 **CBUFLEVEL[11:0]**: Current buffer fill level

Reading this register returns the current fill level of the trace memory in 32-bit words.

This register is cleared when TCEN is low.

ETF buffer level watermark register (ETF_BUFWM)

Address offset: 0x034

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|-------------|------|------|------|------|------|------|------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res | Res | BUFWM[10:0] | | | | | | | | | | |
| | | | | | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:11 Reserved, must be kept at reset value.

Bits 10:0 **BUFWM[10:0]**: Buffer level watermark

The value programmed into this register indicates the required threshold vacancy level in the trace memory in 32-bit words. When the space in the FIFO is less than or equal to this value, that is, Fill level \geq MEM_SIZE - BUFWM, the FULL output is pulled high and the FULL bit in the STS Register is set.

This register is used only in Software FIFO and Hardware FIFO modes. In Circular buffer mode, this functionality can be obtained by programming the RWP to the required vacancy trigger level, so that when the pointer wraps around, the FULL bit is set indicating that the vacancy level has fallen below the required level.

The maximum value that can be written into this register is MEM_SIZE - 1. In this case, the FULL bit output is asserted after the first 32-bit word is written to trace memory.

Writing to this register other than when in disabled state results in unpredictable behavior.

ETF formatter and flush status register (ETF_FFSR)

Address offset: 0x300

Reset value: 0x0000 0002

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|---------------|--------------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | | | | | | | | | r | r |

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **FTSTOPPED**: Formatter stopped

This bit behaves in the same way as the FEMPTY bit in the ETF_STS register.

Bit 0 **FLINPROG**: Flush in progress

Indicates whether a flush on the ATB slave port is in progress. This bit reflects the status of the AFVALIDS output. A flush can be initiated by the flush control bits in the ETF_FFCR register, or requested by the ATB master port.

0: No flush in progress

1: Flush in progress

ETF formatter and flush control register (ETF_FFCR)

Address offset: 0x304

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------|---------------|---------------------|--------------|------|---------------|----------------|----------------|------|--------------|---------------|-------------|------|------|------|------|

| | rw | rw | rw | | rw | rw | rw | | rw | rw | rw | | | rw | rw |

Bits 31:15 Reserved, must be kept at reset value.

Bit 14 **DRAINBUF**: Drain buffer

This bit is used to enable draining of the trace data through the ATB master interface after the formatter has stopped. This is useful in Circular buffer mode to capture trace data into trace memory and then to drain the captured trace through the ATB master interface.

Writing a one to this bit when in Stopped state starts the drain of the trace buffer content through the ATB Master interface. This bit always reads as zero. The READY bit in the ETF_STS register goes low while the drain is in progress.

This bit is only functional when the ETF is in Circular buffer mode and formatting is enabled, that is, the ENFT bit in the ETF_FFCR register is set. Setting this bit when the ETF is in any other mode, or when not in Stopped state, results in Unpredictable behavior.

When trace capture is complete in Circular buffer mode, all of the captured trace must be retrieved from the trace memory through the same mechanism, either read all trace data out through RRD reads, or drain all trace data by setting the DRAINBUF bit. Setting the DRAINBUF bit after some of the captured trace has been read out through RRD results in unpredictable behavior.

Bit 13 **STPONTRGEV**: Stop on trigger event

0: No effect

1: Stop trace capture when a trigger event occurs

Enabling the ETF in Software FIFO mode or Hardware FIFO mode with this bit set results in unpredictable behavior.

Bit 12 **STOPONFL**: Stop on flush

0: No effect

1: Stop trace capture when flush is completed

If a flush is initiated by the ATB master interface, its completion does not lead to a formatter stop regardless of the value programmed in this bit.

Bit 11 Reserved, must be kept at reset value.

Bit 10 **TRIGONFL**: Trigger on flush

0: No effect

1: Indicate a trigger in the trace stream when flush is completed

If ENFT and ENTI are both clear, this bit is ignored and no trigger is inserted into the trace stream.

If a flush is initiated by the ATB master interface, its completion does not lead to a trigger indication regardless of the value programmed in this bit.

Bit 9 **TRGONTRGEV**: Trigger on trigger event

0: No effect

1: Indicate a trigger in the trace stream when trigger event occurs

If ENFT and ENTI are both clear, this bit is ignored and no trigger is inserted into the trace stream.

This bit is not supported in Software FIFO mode or Hardware FIFO mode.

Bit 8 **TRGONTRGIN**: Trigger on trigger in

0: No effect

1: Indicate a trigger in the trace stream when a rising edge is detected on the TRIGIN input.

If ENFT and ENTI are both clear, this bit is ignored and no trigger is inserted into the trace stream.

Bit 7 Reserved, must be kept at reset value.

Bit 6 **FLUSHMAN**: Manual flush

0: No effect

1: Flush the trace FIFO and pipeline

This bit is cleared automatically when the flush completes. If the TCEN bit in the ETF_CTL register is 0, writes to this bit are ignored.

Bit 5 **FONTRGEV**: Flush on trigger event

0: No effect

1: Flush the trace FIFO and pipeline if a trigger event occurs

This bit is not supported in Software FIFO mode or Hardware FIFO mode. If STPONTRGEV is set, this bit is ignored.

Bit 4 **FONFLIN**: Flush on flush in

0: No effect

1: Flush the trace FIFO and pipeline if when a rising edge is detected on the FLUSHIN input

Bits 3:2 Reserved, must be kept at reset value.

Bit 1 **ENTI**: Enable trigger insertion

Setting this bit enables the insertion of triggers in the formatted trace stream. A trigger is flagged by inserting one byte of data 8'h00 with ATID 7'h7D in the trace stream. Trigger indication on the trace stream is further controlled by the register bits TRIGONFL, TRGONTRGEV, and TRGONTRGIN in the FFCR Register. This bit can only be changed when READY is high, and TCEN is low. This bit takes effect only when the ENFT register bit in this register is set. If ENTI bit is set to high when ENFT is low, it results in formatting being enabled.

Bit 0 **ENFT**: Enable formatting.

0: Formatting is disabled. Incoming trace data is assumed to be from a single trace source.
 1: Formatting is enabled.

If multiple ATIDs are received by the ETF when trace capture is enabled and the formatter is disabled, an interleaving of trace data occurs. Disabling of formatting is supported only in Circular buffer mode. If the ETF is enabled in a mode other than Circular buffer mode with ENFT low, then formatting is enabled. If ENTI bit is set to high when ENFT is low, it results in formatting being enabled.

This bit is ignored when in Disabled state.

ETF periodic synchronization counter register (ETF_PSCR)

Address offset: 0x308

Reset value: 0x0000 000A

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|------|------|------|--------------|------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |

| | | | | | | | | | | | rw | rw | rw | rw | rw |

Bits 31:5 Reserved, must be kept at reset value.

Bits 4:0 **PSCOUNT[4:0]**: Synchronization counter reload value

Determines the reload value of the Synchronization Counter. The reload value takes effect the next time the counter reaches zero. Reads from this register return the reload value programmed into this register. This register is set to 0xA on reset, corresponding to a synchronization period of 1024 bytes.

- 0x0: Synchronization disabled
- 0x1-0x6: Reserved
- 0x7-0x1B: Synchronization period is $2^{PSCOUNT}$ bytes
- 0x1C-0x1F: Reserved

ETF lock access register (ETF_LAR)

Address offset: 0xFB0

Reset value: N/A

| | | | | | | | | | | | | | | | |
|-----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | | | | | | | | r | r | r |

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **LOCKTYPE**: Size of the ETF_LAR register

0: 32-bit

Bit 1 **LOCKGRANT**: Current status of lock

This bit always returns zero when read by an external debugger.

0: Write access is permitted

1: Write access is blocked. Only read access is permitted.

Bit 0 **LOCKEXIST**: Existence of lock control mechanism

The bit indicates whether a lock control mechanism exists. It always returns zero when read by an external debugger.

0: No lock control mechanism exists

1: Lock control mechanism is implemented

ETF authentication status register (ETF_AUTHSTAT)

Address offset: 0xFB8

Reset value: 0x0000 0000

| | | | | | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:11 Reserved, must be kept at reset value.

Bits 10:8 **MEMWIDTH[2:0]**: Memory interface data bus width
 0x3: 64 bits (corresponds to 32-bit ATB data)

Bits 7:6 **CONFIGTYP[1:0]**: Configuration type of component (ETB, ETR or ETF)
 0x2: ETF

Bit 5 **CLKSCHEM**: RAM clocking scheme (synchronous or asynchronous)
 0: Synchronous

Bits 4:0 **ATBINPORTCNT[4:0]**: Number/type of ATB input port multiplexing
 0x0: None

ETF device type identifier register (ETF_DEVTYPE)

Address offset: 0xFCC

Reset value: 0x0000 0032

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|--------------|------|------|------|----------------|------|------|------|

60.5.6 Trace port interface unit (TPIU)

The TPIU is a CoreSight™ component that formats the trace stream and outputs it on the external trace port signals. The TPIU has a single ATB slave port for incoming trace data. The trace port is a synchronous parallel port, comprising a clock output, TRACECK, and four data outputs, TRACED(7:0). The trace port width is programmable in the range 1 to 8. Using a smaller port width reduces the number of test points/connector pins needed, and frees up IOs for other purposes. However it restricts the bandwidth of the trace port and hence the quantity of trace information that can be output in real time. The TRACECK output must be enabled by setting the TRACECLKEN bit in the DBGMCU_CR register before trace is sent to the TPIU. Furthermore, the TRACECK frequency can be programmed in the RCC.

For more information on the Trace port interface CoreSight™ component, refer to the Arm® CoreSight™ SoC-400 technical reference manual [2].

TPIU registers

TPIU supported port size register (TPIU_SUPPSIZE)

Address offset: 0x000

Reset value: 0x0000 000F

| | | | | | | | | | | | | | | | |
|-----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| PORTSIZE[31:16] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| PORTSIZE[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:0 **PORTSIZE[31:0]**: Indicates supported trace port sizes, from 1 to 32 pins. Bit n-1 when set indicates that port size n is supported.

0x0000 000F: Port sizes 1 to 4 supported

TPIU current port size register (TPIU_CURPSIZE)

Address offset: 0x004

Reset value: 0x0000 0001

| | | | | | | | | | | | | | | | |
|-----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| PORTSIZE[31:16] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| PORTSIZE[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **PORTSIZE[31:0]**: Current trace port size

Setting bit n-1 indicates that the current port size is n-pin wide. The value of n must be within the range of supported port sizes (1-4). Only one bit can be set, or unpredictable behavior may result. This register should only be modified when the formatter is stopped.

TPIU supported trigger modes register (TPIU_SUPTRGM)

Address offset: 0x100

Reset value: 0x0000 011F

| | | | | | | | | | | | | | | | |

| | | | | | | | r | | | | r | r | r | r | r |

Bits 31:18 Reserved, must be kept at reset value.

Bit 17 **TRGRUN**: Trigger running
 0: Trigger has not occurred or counter is at 0
 1: Trigger has occurred and counter is not at 0

Bit 16 **TRIGD**: Triggered
 0: Trigger has not occurred
 1: Trigger has occurred and counter has reached 0

Bits 15:9 Reserved, must be kept at reset value.

Bit 8 **TCOUNT8**: 8-bit counter register
 1: Implemented

Bits 7:5 Reserved, must be kept at reset value.

Bit 4 **MULT64K**: Multiplying the trigger counter by 65536 support
 1: Supported

Bit 3 **MULT256**: Multiplying the trigger counter by 256 support
 1: Supported

Bit 2 **MULT16**: Multiplying the trigger counter by 16 support
 1: Supported

Bit 1 **MULT4**: Multiplying the trigger counter by 4 support
 1: Supported

Bit 0 **MULT2**: Multiplying the trigger counter by 2 support
 1: Supported

TPIU trigger counter value register (TPIU_TRGCNT)

Address offset: 0x104

Reset value: 0x0000 0000

| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | TRIGCOUNT[7:0] | | | | | | | |
| | | | | | | | | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **TRIGCOUNT[7:0]**: Enable trigger delay indication
 Enables delaying trigger flagging to any external connected trace capture or storage devices. This counter is only eight bits wide and is intended to be used only with the counter multipliers in the Trigger multiplier register, 0x108. When a trigger is started, this value, in conjunction with the multiplier, specifies the number of words before the trigger is indicated. When the trigger counter reaches 0, the value written here is reloaded. Writing to this register causes the trigger counter value to reset but does not reset any value on the multiplier. Reading this register returns the preset value, not the current count.

TPIU trigger multiplier register (TPIU_TRGMULT)

Address offset: 0x108

Reset value: 0x0000 0000

Bits 31:18 Reserved, must be kept at reset value.

Bit 17 **PCONTEN**: Continuous mode support
1: Supported

Bit 16 **PTIMEEN**: Timed mode support
1: Supported

Bits 15:4 Reserved, must be kept at reset value.

Bit 3 **PATF0**: Support of FF/00 pattern
Indicates whether the FF/00 pattern is supported as output over the trace port.
1: Supported

Bit 2 **PATA5**: Support of AA/55 pattern
Indicates whether the AA/55 pattern is supported as output over the trace port.
1: Supported

Bit 1 **PATW0**: Support of walking 0's pattern
Indicates whether the walking 0's pattern is supported as output over the trace port.
1: Supported

Bit 0 **PATW1**: Support of walking 1's pattern
Indicates whether the walking 1's pattern is supported as output over the trace port.
1: Supported

TPIU current test pattern/mode register (TPIU_CURTPM)

Address offset: 0x204

Reset value: 0x0000 0000

Bits 31:18 Reserved, must be kept at reset value.

Bit 17 **PCONTEN**: Continuous mode enable
0: Disabled
1: Enabled

Bit 16 **PTIMEEN**: Timed mode enable
0: Disabled
1: Enabled

Bits 15:4 Reserved, must be kept at reset value.

Bit 3 **PATF0**: FF/00 pattern enable
Indicates whether the FF/00 pattern is enabled as output over the trace port
0: Disabled
1: Enabled

Bit 2 **PATA5**: AA/55 pattern is enable

Indicates whether the AA/55 pattern is enabled as output over the trace port

0: Disabled

1: Enabled

Bit 1 **PATW0**: Walking 0's pattern enable

Indicates whether the walking 0's pattern is enabled as output over the trace port

0: Disabled

1: Enabled

Bit 0 **PATW1**: Walking 1's pattern enable

Indicates whether the walking 1's pattern is enabled as output over the trace port

0: Disabled

1: Enabled

TPIU test pattern repeat counter register (TPIU_TPRCR)

Address offset: 0x208

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|----------------|------|------|------|------|------|------|------|--|--|

| | | | | | | | | rw | rw | rw | rw | rw | rw | rw | rw | | |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **PATTCOUNT[7:0]**: Number of TRACECLKIN cycles

The field provides a 8-bit counter value to indicate the number of TRACECLKIN cycles for which a pattern runs before it switches to the next pattern.

TPIU formatter and flush status register (TPIU_FFSR)

Address offset: 0x300

Reset value: 0x0000 0002

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|------|------|------|------|------|---------------|---------------|--------------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |

| | | | | | | | | | | | | | r | r | r |

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **TCPRESENT**: TRACECTL output pin availability
 Indicates whether the optional TRACECTL output pin is available for use.

0: TRACECTL pin is not present in this device.

Bit 1 **FTSTOPPED**: Formatter stopped
 The formatter has received a stop request signal and all trace data and post-amble is sent. Any additional trace data on the ATB interface is ignored.

0: Formatter has not stopped
 1: Formatter has stopped

Bit 0 **FLINPROG**: Flush in progress
 Indicates whether a flush on the ATB slave port is in progress. This bit reflects the status of the AFVALIDS output. A flush can be initiated by the flush control bits in the TPIU_FFCR register.

0: No flush in progress
 1: Flush in progress

TPIU formatter and flush control register (TPIU_FFCR)

Address offset: 0x304

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------|------|----------|--------|------|--------|---------|--------|------|---------|---------|---------|------|------|---------|-------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| | | rw | rw | | rw | rw | rw | | rw | rw | rw | | | rw | rw |

Bits 31:14 Reserved, must be kept at reset value.

Bit 13 **STOPTRIG**: Stop on trigger event
 0: No effect
 1: Stop formatter when a trigger event occurs

Bit 12 **STOPFL**: Stop on flush
 0: No effect
 1: Stop formatter when flush is completed

Bit 11 Reserved, must be kept at reset value.

Bit 10 **TRIGFL**: Trigger on flush
 0: No effect
 1: Indicate a trigger in the trace stream when flush is completed

Bit 9 **TRIGEVT**: Trigger on trigger event
 0: No effect
 1: Indicate a trigger in the trace stream when trigger event occurs

Bit 8 **TRIGIN**: Trigger on trigger in
 0: No effect
 1: Indicate a trigger in the trace stream when the TRIGIN input from the system CTI is asserted.

Bit 7 Reserved, must be kept at reset value.

Bit 6 **FONMAN**: Generate a manual flush
 0: No effect
 1: Flush the trace

This bit is cleared automatically when the flush completes.

Bit 5 **FONTRIG**: Flush on trigger event
 A trigger event occurs when the trigger counter reaches 0, or, if the trigger counter is 0, when the TRIGIN input from the system CTI is high.

0: No effect
 1: Flush the trace if a trigger event occurs

Bit 4 **FONFLIN**: Flush on flush in
 0: No effect
 1: Flush the trace if the FLUSHIN input from the system CTI is asserted

Bits 3:2 Reserved, must be kept at reset value.

Bit 1 **ENFCONT**: Enable continuous formatting
 0: Continuous formatting is disabled
 1: Continuous formatting is enabled

Bit 0 **ENFTC**: Enable the embedding of triggers in formatted trace
 0: Formatting is disabled
 1: Formatting is enabled

TPIU formatter synchronization counter register (TPIU_FSCR)

Address offset: 0x400

Reset value: 0x0000 0040

| | | | | | | | | | | | | | | | |
|------|------|------|------|----------------|------|------|------|------|------|------|------|------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | CYCCOUNT[11:0] | | | | | | | | | | | |
| | | | | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w |

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:0 **CYCCOUNT[11:0]**: Enables effective use of TPAs

Enables effective use of different-sized TPAs without wasting large amounts of storage capacity of the capture device. This counter contains the number of formatter frames since the last synchronization packet of 128 bits. It is a 12-bit counter with a maximum count value of 4096. This equates to synchronization every 65536 bytes, that is, 4096 packets x 16 bytes per packet. The default is set up for a synchronization packet every 1024 bytes, that is, every 64 formatter frames. If the formatter is configured for continuous mode, full and half-word sync frames are inserted during normal operation. Under these circumstances, the count value is the maximum number of complete frames between full synchronization packets.

TPIU claim tag set register (TPIU_CLAIMSET)

Address offset: 0xFA0

Reset value: 0x0000 000F

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|------|------|------|------|---------------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | CLAIMSET[3:0] | | | |
| | | | | | | | | | | | | rw | rw | rw | rw |

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CLAIMSET[3:0]**: Set claim tag bits

Write:
 0000: No effect
 xxx1: Set bit 0
 xx1x: Set bit 1
 x1xx: Set bit 2
 1xxx: Set bit 3

Read:
 0xF: Indicates there are four bits in claim tag

TPIU claim tag clear register (TPIU_CLAIMCLR)

Address offset: 0xFA4

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|------|------|------|------|---------------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | CLAIMCLR[3:0] | | | |
| | | | | | | | | | | | | rw | rw | rw | rw |

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CLAIMCLR[3:0]**: Reset claim tag bits

Write:

0000: No effect

xxx1: Clear bit 0

xx1x: Clear bit 1

x1xx: Clear bit 2

1xxx: Clear bit 3

Read: Returns current value of claim tag

TPIU lock access register (TPIU_LAR)

Address offset: 0xFB0

Reset value: 0xFFFF XXXX

| | | | | | | | | | | | | | | | |
|-----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| ACCESS_W[31:16] | | | | | | | | | | | | | | | |
| w | w | w | w | w | w | w | w | w | w | w | w | w | w | w | w |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| ACCESS_W[15:0] | | | | | | | | | | | | | | | |
| w | w | w | w | w | w | w | w | w | w | w | w | w | w | w | w |

Bits 31:0 **ACCESS_W[31:0]**: TPIU register access enable

Enables write access to some TPIU registers by processor cores (debuggers do not need to unlock the component)

0xC5ACCE55: Enable write access

Other values: Disable write access

TPIU lock status register (TPIU_LSR)

Address offset: 0xFB4

Reset value: 0x0000 0003

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|------|------|------|------|------|--------------|---------------|---------------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |

| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | LOCKT YPE | LOCKG RANT | LOCKE XIST |
| | | | | | | | | | | | | | r | r | r |

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **LOCKTYPE**: Size of the TPIU_LAR register
 0: 32-bit

Bit 1 **LOCKGRANT**: Current status of lock
 This bit always returns zero when read by an external debugger.

0: Write access is permitted
 1: Write access is blocked. Only read access is permitted.

Bit 0 **LOCKEXIST**: Implementation of a lock control mechanism
 The bit indicates whether a lock control mechanism is implemented. It always returns zero when read by an external debugger.

0: No lock control mechanism is available
 1: Lock control mechanism is implemented

TPIU authentication status register (TPIU_AUTHSTAT)

Address offset: 0xFB8

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|-----------|------|----------|------|------------|------|-----------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:6 **SNID[1:0]**: Security level for secure non-invasive debug
 0x0: Not implemented

Bits 5:4 **SID[1:0]**: Security level for secure invasive debug
 0x0: Not implemented

Bits 3:2 **NSNID[1:0]**: Security level for non-secure non-invasive debug
 0x0: Not implemented

Bits 1:0 **NSID[1:0]**: Security level for non-secure invasive debug
 0x0: Not implemented

TPIU device configuration register (TPIU_DEVID)

Address offset: 0xFC8

Reset value: 0x0000 00A0

| | | | | | | | | | | | | | | | |
|------|------|------|------|--------------------|------------|--------------|----------------|------|------|--------------|-------------|------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |

| | | | | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:12 Reserved, must be kept at reset value.

Bit 11 **SWOUARTNRZ**: Support of SWO UART or NRZ

Indicates whether serial wire output, UART or NRZ, is supported.

0: Not supported

Bit 10 **SWOMAN**: Support of SWO Manchester format

Indicates whether serial wire output, Manchester encoded format, is supported.

0: Not supported

Bit 9 **TCLKDATA**: Support of trace clock plus data

0: Not supported

Bits 8:6 **FIFOSIZE[2:0]**: FIFO size in powers of 2

0x2: FIFO size = 4 (16 bytes)

Bit 5 **CLKRELAT**: ATB clock and TRACECLKIN relation

Indicates the relationship between the ATB clock and TRACECLKIN (synchronous or asynchronous)

1: Asynchronous

Bits 4:0 **MAXNUM[4:0]**: Number/type of ATB input port multiplexing

0x0: None

TPIU device type identifier register (TPIU_DEVTYPE)

Address offset: 0xFCC

Reset value: 0x0000 0011

60.5.7 Serial wire output (SWO) and SWO trace funnel (SWTF)

The SWO is a CoreSight component that formats the trace stream from the processor ITM and outputs it on the single wire TRACESWO output. The SWO trace funnel (SWTF) must be programmed to enable the trace bus from the Cortex-M7 ITM before trace is enabled. The SWTF registers are listed in [Table 618](#).

Compared to the TPIU, the SWO contains:

- no formatter
- no pattern generator
- an 8-bit ATB input
- no synchronous trace output, that is, no TRACEDATA or TRACECLK pins
- no support for flush, because this is not required
- no support for triggering

The SWO output supports Manchester encoded and UART NRZ formats.

For more information about the serial wire output CoreSight™ component, refer to the Arm® CoreSight™ Components Technical Reference Manual [4].

SWO registers

SWO current output divisor register (SWO_CODR)

Address offset: 0x010

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------|------|------|-----------------|------|------|------|------|------|------|------|------|------|------|------|------|

| | | | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w |

Bits 31:13 Reserved, must be kept at reset value.

Bits 12:0 **PRESCALER[12:0]**: SWO baud rate scaling

The baud rate is the trace clock frequency divided by (PRESCALER - 1). The baud rate changes instantly, so it is recommended to stop the trace source and wait until the port is idle before writing to this register.

SWO selected pin protocol register (SWO_SPPR)

Address offset: 0x0F0

Reset value: 0x0000 0001

| | | | | | | | | | | | | | | | |

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **FTNONSTOP**: Change of settings without stopping formatter
 1: Change of settings is allowed with formatter running

Bit 2 **TCPRESENT**: TRACECTL pin present on SWO
 0: TRACECTL pin not present

Bit 1 **FTSTOPPED**: Formatter stopped
 0: Formatter running
 The bit always returns 0 as the SWO formatter cannot be stopped in this device.

Bit 0 **FLINPROG**: Flush in progress
 0: Flush is not in progress
 The bit always returns 0 as SWO flushing is not supported in this device.

SWO claim tag set register (SWO_CLAIMSET)

Address offset: 0xFA0

Reset value: 0x0000 000F

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|------|------|------|------|---------------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | CLAIMSET[3:0] | | | |
| | | | | | | | | | | | | r | r | r | r |

Bits 31:0 **ACCESS_W[31:0]**: SWO register write access enable

Enables write access to some SWO registers by processor cores (debuggers do not need to unlock the component)

0xC5ACCE55: Enable write access

Other values: Disable write access

SWO lock status register (SWO_LSR)

Address offset: 0xFB4

Reset value: 0x0000 0003

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|------|------|------|------|------|----------|-----------|-----------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | LOCKTYPE | LOCKGRANT | LOCKEXIST |
| | | | | | | | | | | | | | r | r | r |

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **LOCKTYPE**: Size of the SWO_LAR register

0: 32-bit

Bit 1 **LOCKGRANT**: Current status of lock

This bit always returns zero when read by an external debugger.

0: Write access is permitted

1: Write access is blocked - only read access is permitted

Bit 0 **LOCKEXIST**: Implementation of a lock control mechanism

The bit indicates whether a lock control mechanism is implemented. It always returns zero when read by an external debugger.

0: No lock control mechanism is available

1: Lock control mechanism is implemented

SWO authentication status register (SWO_AUTHSTAT)

Address offset: 0xFB8

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|-----------|------|----------|------|------------|------|-----------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | | | r | r | r | r | r | r | r | r |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:6 **SNID[1:0]**: Security level for secure non-invasive debug
 0x0: Not implemented

Bits 5:4 **SID[1:0]**: Security level for secure invasive debug
 0x0: Not implemented

Bits 3:2 **NSNID[1:0]**: Security level for non-secure non-invasive debug
 0x0: Not implemented

Bits 1:0 **NSID[1:0]**: Security level for non-secure invasive debug
 0x0: Not implemented

SWO device configuration register (SWO_DEVID)

Address offset: 0xFC8

Reset value: 0x0000 0EA0

| | | | | | | | | | | | | | | | |
|------|------|------|------|--------------------|------------|--------------|----------------|------|------|--------------|-------------|------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | SWO UART NRZ | SWO MAN | TCLK DATA | FIFO SIZE[2:0] | | | CLK RELAT | MUXNUM[4:0] | | | | |
| | | | | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:11 Reserved, must be kept at reset value.

Bit 11 **SWOUARTNRZ**: SWO UART or NRZ support
 Indicates whether serial wire output, UART or NRZ, is supported.

1: Supported

Bit 10 **SWOMAN**: SWO Manchester format support
 Indicates whether serial wire output, Manchester encoded format, is supported.

1: Supported

Bit 9 **TCLKDATA**: Trace clock plus data support
 Indicates whether trace clock plus data is supported

1: Supported

Bits 8:6 **FIFOSIZE[2:0]**: FIFO size in powers of 2
 0x2: FIFO size = 4 (16 bytes)

Bit 5 **CLKRELAT**: ATB clock to TRACECLKIN relation
 Indicates the relationship between the ATB clock and TRACECLKIN (synchronous or asynchronous)

1: Asynchronous

Bits 4:0 **MUXNUM[4:0]**: Number/type of ATB input port multiplexing
 0x0: None

SWO device type identifier register (SWO_DEVTYPE)

Address offset: 0xFCC

Reset value: 0x0000 0011

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|--------------|------|------|------|----------------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | | | r | r | r | r | r | r | r | r |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **SUBTYPE[3:0]**: Sub-classification

0x1: Trace port component

Bits 3:0 **MAJORTYPE[3:0]**: Major classification

0x1: Trace sink component

SWO CoreSight peripheral identity register 4 (SWO_PIDR4)

Address offset: 0xFD0

Reset value: 0x0000 0004

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|--------------|------|------|------|----------------|------|------|------|

| | | | | | | | | r | r | r | r | r | r | r | r |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **4KCOUNT[3:0]**: Register file size

0x0: Register file occupies a single 4 Kbyte region

Bits 3:0 **JEP106CON[3:0]**: JEP106 continuation code

0x4: Arm® JEDEC code

SWO CoreSight peripheral identity register 0 (SWO_PIDR0)

Address offset: 0xFE0

Reset value: 0x0000 0014

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|--------------|------|------|------|------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | | | | | | | | rw | rw | rw |

Bits 31:3 Reserved, must be kept at reset value.

Bits 2:0 **PRIPORT0[2:0]**: Slave port S0 priority
 0: Highest priority
 :
 7: Lowest priority

SWTF claim tag set register (SWTF_CLAIMSET)

Address offset: 0xFA0

Reset value: 0x0000 000F

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|------|------|------|------|---------------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | | | | | | | rw | rw | rw | rw |

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CLAIMSET[3:0]**: Set claim tag bits

Write:
 0000: No effect
 xxx1: Set bit 0
 xx1x: Set bit 1
 x1xx: Set bit 2
 1xxx: Set bit 3

Read:
 0xF: Indicates there are four bits in claim tag

SWTF claim tag clear register (SWTF_CLAIMCLR)

Address offset: 0xFA4

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|------|------|------|------|---------------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |

| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | CLAIMCLR[3:0] | | | |
| | | | | | | | | | | | | rw | rw | rw | rw |

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CLAIMCLR[3:0]**: Reset claim tag bits

Write:
 0000: No effect
 xxx1: Clear bit 0
 xx1x: Clear bit 1
 x1xx: Clear bit 2
 1xxx: Clear bit 3

Read: Returns current value of claim tag

SWTF lock access register (SWTF_LAR)

Address offset: 0xFB0

Reset value: N/A

| | | | | | | | | | | | | | | | |
|-----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| ACCESS_W[31:16] | | | | | | | | | | | | | | | |
| w | w | w | w | w | w | w | w | w | w | w | w | w | w | w | w |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| ACCESS_W[15:0] | | | | | | | | | | | | | | | |
| w | w | w | w | w | w | w | w | w | w | w | w | w | w | w | w |

Bits 31:0 **ACCESS_W[31:0]**: SWTF register write access enable

Enables write access to some SWTF registers by processor cores (debuggers do not need to unlock the component)

0xC5ACCE55: Enable write access

Other values: Disable write access

SWTF lock status register (SWTF_LSR)

Address offset: 0xFB4

Reset value: 0x0000 0003

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|------|------|------|------|------|----------|-----------|-----------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | LOCKTYPE | LOCKGRANT | LOCKEXIST |
| | | | | | | | | | | | | | r | r | r |

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **LOCKTYPE**: Size of the SWTF_LAR register

0: 32-bit

Bit 1 **LOCKGRANT**: Current status of lock

This bit always returns zero when read by an external debugger.

0: Write access is permitted

1: Write access is blocked - only read access is permitted

Bit 0 **LOCKEXIST**: Existence of lock control mechanism

The bit indicates whether a lock control mechanism exists. It always returns zero when read by an external debugger.

0: No lock control mechanism exists

1: Lock control mechanism is implemented

SWTF authentication status register (SWTF_AUTHSTAT)

Address offset: 0xFB8

Reset value: 0x0000 000A

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|-----------|------|----------|------|------------|------|-----------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |

| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | SNID[1:0] | | SID[1:0] | | NSNID[1:0] | | NSID[1:0] | |
| | | | | | | | | r | r | r | r | r | r | r | r |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:6 **SNID[1:0]**: Security level for secure non-invasive debug
 0x0: Not implemented

Bits 5:4 **SID[1:0]**: Security level for secure invasive debug
 0x0: Not implemented

Bits 3:2 **NSNID[1:0]**: Security level for non-secure non-invasive debug
 0x2: Disabled
 0x3: Enabled

Bits 1:0 **NSID[1:0]**: Security level for non-secure invasive debug
 0x2: Disabled
 0x3: Enabled

SWTF CoreSight device identity register (SWTF_DEVID)

Address offset: 0xFC8

Reset value: 0x0000 0022

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|-------------|------|------|------|--------------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

60.5.8 Microcontroller debug unit (DBGMCU)

The DBGMCU component contains a number of registers that control the power and clock behavior in Debug mode. Specifically it allows the debugger, or debug software, to:

- maintain the clock and power to the processor cores when in low-power modes (sleep, stop or standby)
- maintain the clock and power to the system debug and trace components when in low power modes
- stop the clock to certain peripherals (CAN, SMBUS timeout, Watchdogs, Timers, RTC) when either the processor core is stopped in Debug mode. For timers having complementary outputs, these outputs are disabled (as if the MOE bit was reset) for safety purposes when the counter is stopped (TIM1/8/15/16/17 = 1 in DBGMCU_APB2FZ1).

The DBGMCU registers are not reset by a system reset, only by a power on reset. They are accessible to the debugger via the APB-D bus at base address 0xE00E1000. They are also accessible by the processor core at base address 0x5C001000.

Note: the DBGMCU is not a standard CoreSight component. Therefore, it does not appear in the system ROM table.

DBGMCU registers

DBGMCU identity code register (DBGMCU_IDC)

Address offset: 0x000

Reset value: 0xX00X 6450

| | | | | | | | | | | | | | | | |

Bits 31:16 **REV_ID[15:0]**: Revision
 0x1001 = Revision Z
 0x1003 = Revision Y
 0x2001 = Revision X
 0x2003 = Revision V

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:0 **DEV_ID[11:0]**: Device ID
 0x450: STM32H742, STM32H743/753 and STM32H750

DBGMCU configuration register (DBGMCU_CR)

Address offset: 0x004

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------|------|------|------------|------|------|------|------|------|---------------|---------------|----------------|------|----------------|----------------|---------------------|

| | | | | | | | | | | | | | rw | rw | rw |

Bits 31:29 Reserved, must be kept at reset value.

Bit 28 **TRGOEN**: External trigger output enable

This bit controls the direction of the bi-directional trigger pin, TRGIO.

0: Input - TRGIO is connected to TRGIN

1: Output - TRGIO is connected to TRGOUT

Bits 27:23 Reserved, must be kept at reset value.

Bit 22 **D3DBGCKEN**: D3 debug clock enable

This bit allows the debug components in the D3 domain (excluding the DAPCLK domain) to be switched off if they are not needed.

0: Disabled - D3 domain debug components are disabled and their clocks gated

1: Enabled - D3 domain debug components are clocked whenever the corresponding domain clock (CK_HCLK_D3) is active

Bit 21 **D1DBGCKEN**: D1 debug clock enable

This bit allows the debug components in the D1 domain (excluding those in the processor core) to be switched off if they are not needed.

0: Disabled - D1 domain debug components are disabled and their clocks gated

1: Enabled - D1 domain debug components are clocked whenever the corresponding domain clock (CK_HCLK_D1) is active

Bit 20 **TRACECLKEN**: Trace port clock enable

This bit enables the trace port clock, TRACECLK.

0: Disabled - TRACECLK is disabled

1: Enabled - TRACECLK is active

Bits 19:3 Reserved, must be kept at reset value.

Bit 2 **DBGSTBY_D1**: D1 domain debug in Standby mode enable

0: Normal operation - all clocks is disabled and the domain powered down automatically in Standby mode.

1: Automatic clock stop/power-down disabled - all active clocks and oscillators continue to run during Standby mode, and the domain supply is maintained, allowing full debug capability. On exit from Standby mode, a domain reset is performed.

Bit 1 **DBGSTOP_D1**: D1 domain debug in Stop mode enable

0: Normal operation - all clocks are disabled automatically in Stop mode

1: Automatic clock stop disabled - all active clocks and oscillators continue to run during Stop mode, allowing full debug capability. On exit from Stop mode, the clock settings is set to the Stop mode exit state.

Bit 0 **DBGSLEEP_D1**: D1 domain debug in Sleep mode enable

0: Normal operation - processor clock is stopped automatically in Sleep mode

1: Automatic clock stop disabled - processor clock continues to run, allowing full debug capability

DBGMCU APB3 peripheral freeze register (DBGMCU_APB3FZ1)

Address offset: 0x034

Reset value: 0x0000 0000

| | | | | | | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w |

Bits 31:24 Reserved, must be kept at reset value.

Bit 23 **DBG_I2C3**: I2C3 SMBUS timeout stop in debug

- 0: Normal operation - I2C3 SMBUS timeout continues operating while the core is in Debug mode
- 1: Stop in debug - I2C3 SMBUS timeout is frozen while Cortex-M7 is in Debug mode

Bit 22 **DBG_I2C2**: I2C2 SMBUS timeout stop in debug

- 0: Normal operation - I2C2 SMBUS timeout continues operating while the core is in Debug mode
- 1: Stop in debug - I2C2 SMBUS timeout is frozen while Cortex-M7 is in Debug mode

Bit 21 **DBG_I2C1**: I2C1 SMBUS timeout stop in debug

- 0: Normal operation - I2C1 SMBUS timeout continues operating while the core is in Debug mode
- 1: Stop in debug - I2C1 SMBUS timeout is frozen while the core is in Debug mode

Bits 20:11 Reserved, must be kept at reset value.

Bit 10 Reserved, must be kept at reset value.

Bit 9 **DBG_LPTIM1**: LPTIM1 stop in debug

- 0: Normal operation - LPTIM1 continues operating while the core is in Debug mode
- 1: Stop in debug - LPTIM1 is frozen while Cortex-M7 is in Debug mode

Bit 8 **DBG_TIM14**: TIM14 stop in debug

- 0: Normal operation - TIM14 continues operating while the core is in Debug mode
- 1: Stop in debug - TIM14 is frozen while Cortex-M7 is in Debug mode

Bit 7 **DBG_TIM13**: TIM13 stop in debug

- 0: Normal operation - TIM13 continues operating while the core is in Debug mode
- 1: Stop in debug - TIM13 is frozen while Cortex-M7 is in Debug mode

Bit 6 **DBG_TIM12**: TIM12 stop in debug

- 0: Normal operation - TIM12 continues operating while the core is in Debug mode
- 1: Stop in debug - TIM12 is frozen while Cortex-M7 is in Debug mode

Bit 5 **DBG_TIM7**: TIM7 stop in debug

- 0: Normal operation - TIM7 continues operating while the core is in Debug mode
- 1: Stop in debug - TIM7 is frozen while Cortex-M7 is in Debug mode

Bit 4 **DBG_TIM6**: TIM6 stop in debug

- 0: Normal operation - TIM6 continues operating while the core is in Debug mode
- 1: Stop in debug - TIM6 is frozen while Cortex-M7 is in Debug mode

Bit 3 **DBG_TIM5**: TIM5 stop in debug

- 0: Normal operation - TIM5 continues operating while the core is in Debug mode
- 1: Stop in debug - TIM5 is frozen while Cortex-M7 is in Debug mode

Bit 2 **DBG_TIM4**: TIM4 stop in debug

- 0: Normal operation - TIM4 continues operating while the core is in Debug mode
- 1: Stop in debug - TIM4 is frozen while Cortex-M7 is in Debug mode

Bit 1 **DBG_TIM3**: TIM3 stop in debug

- 0: Normal operation - TIM3 continues operating while the core is in Debug mode
- 1: Stop in debug - TIM3 is frozen while Cortex-M7 is in Debug mode

Bit 0 **DBG_TIM2**: TIM2 stop in debug

- 0: Normal operation - TIM2 continues operating while the core is in Debug mode
- 1: Stop in debug - TIM2 is frozen while Cortex-M7 is in Debug mode

DBGMCU APB2 peripheral freeze register (DBGMCU_APB2FZ1)

Address offset: 0x04C

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------|------|-----------|------|------|------|------|------|------|------|------|------|------|-----------|-----------|-----------|

Bits 31:30 Reserved, must be kept at reset value.

Bit 29 **DBG_HRTIM**: HRTIM stop in debug

- 0: Normal operation - HRTIM continues operating while the core is in Debug mode
- 1: Stop in debug - HRTIM is frozen while Cortex-M7 is in Debug mode

Bits 28:18 Reserved, must be kept at reset value.

Bit 18 **DBG_TIM17**: TIM17 stop in debug

- 0: Normal operation - TIM17 continues operating while the core is in Debug mode
- 1: Stop in debug - TIM17 is frozen and TIM17 outputs are disabled while Cortex-M7 is in Debug mode

Bit 17 **DBG_TIM16**: TIM16 stop in debug

- 0: Normal operation - TIM16 continues operating while the core is in Debug mode
- 1: Stop in debug - TIM16 is frozen and TIM16 outputs are disabled while Cortex-M7 is in Debug mode

Bit 16 **DBG_TIM15**: TIM15 stop in debug

- 0: Normal operation - TIM15 continues operating while the core is in Debug mode
- 1: Stop in debug - TIM15 is frozen and TIM15 outputs are disabled while Cortex-M7 is in Debug mode

Bits 15:2 Reserved, must be kept at reset value.

Bit 1 **DBG_TIM8**: TIM8 stop in debug

- 0: Normal operation - TIM8 continues operating while the core is in Debug mode
- 1: Stop in debug - TIM8 is frozen and TIM8 outputs are disabled while Cortex-M7 is in Debug mode

Bit 0 **DBG_TIM1**: TIM1 stop in debug

- 0: Normal operation - TIM1 continues operating while the core is in Debug mode
- 1: Stop in debug - TIM1 is frozen and TIM1 outputs are disabled while Cortex-M7 is in Debug mode.

Bits 31:19 Reserved, must be kept at reset value.

Bit 18 **DBG_IWDG1**: Independent watchdog for D1 stop in debug

0: Normal operation - watchdog continues to count while the core is in Debug mode

1: Stop in debug - watchdog is frozen while Cortex-M7 is in Debug mode

Bit 17 Reserved, must be kept at reset value.

Bit 16 **DBG_RTC**: RTC stop in debug

0: Normal operation - RTC continues operating while the core is in Debug mode

1: Stop in debug - RTC is frozen while Cortex-M7 is in Debug mode

Bits 15:13 Reserved, must be kept at reset value.

Bit 12 **DBG_LPTIM5**: LPTIM5 stop in debug

0: Normal operation - LPTIM5 continues operating while the core is in Debug mode

1: Stop in debug - LPTIM5 is frozen while Cortex-M7 is in Debug mode

Bit 11 **DBG_LPTIM4**: LPTIM4 stop in debug

0: Normal operation - LPTIM4 continues operating while the core is in Debug mode

1: Stop in debug - LPTIM4 is frozen while Cortex-M7 is in Debug mode

Bit 10 **DBG_LPTIM3**: LPTIM2 stop in debug

0: Normal operation - LPTIM2 continues operating while the core is in Debug mode

1: Stop in debug - LPTIM2 is frozen while Cortex-M7 is in Debug mode

Bit 9 **DBG_LPTIM2**: LPTIM2 stop in debug

0: Normal operation - LPTIM2 continues operating while the core is in Debug mode

1: Stop in debug - LPTIM2 is frozen while Cortex-M7 is in Debug mode

Bit 8 Reserved, must be kept at reset value.

Bit 7 **DBG_I2C4**: I2C4 SMBUS timeout stop in debug

0: Normal operation - I2C4 SMBUS timeout continues operating while the core is in Debug mode

1: Stop in debug - I2C4 SMBUS timeout is frozen while the core is in Debug mode

Bits 6:0 Reserved, must be kept at reset value.

60.6 Cortex-M7 debug functional description

The Cortex-M7 subsystem features the following CoreSight™ components:

- ROM tables
- System control space (SCS)
- Breakpoint unit (FPB)
- Data watchpoint and trace unit (DWT)
- Instrumentation trace macrocell (ITM)
- Embedded trace macrocell (ETM)
- Cross trigger interface (CTI)

These components are accessible by the debugger via the Cortex-M7 AHB-AP and its associated AHBD bus.

60.6.1 Cortex-M7 ROM tables

The ROM table is a CoreSight™ component that contains the base addresses of all the CoreSight debug components accessible via the AHBD. These tables enable a debugger to access the topology of the CoreSight system automatically.

There are two ROM tables in the Cortex-M7 sub-system:

- Cortex-M7 processor ROM table
This table is pointed to by the BASE register in the Cortex-M7 AHB-AP. It contains the base address pointers for the ETM and CTI, as well as for the Cortex-M7 PPB ROM table.
- Cortex-M7 PPB (private peripheral bus) ROM table
This table contains pointers to the Cortex-M7 System Control Space registers allowing the debugger to identify the CPU core, as well as to the remaining CoreSight components in the Cortex-M7 subsystem: FPB, DWT and ITM.

The processor ROM table occupies a 4-Kbyte, 32-bit wide chunk of AHBD address space, from 0xE00FE000 to 0xE00FEFFC.

Table 620. Cortex-M7 processor ROM table

| Address in ROM table | Component name | Component base address | Component address offset | Size | Entry |
|--------------------------|-------------------------|------------------------|--------------------------|---------|-------------------------------|
| 0xE00FE000 | Cortex-M7 PPB ROM table | 0xE00FF000 | 0x00001000 | 4 Kbyte | 0x00001003 |
| 0xE00FE004 | Cortex-M7 ETM | 0xE0041000 | 0xFFF43000 | 4 Kbyte | 0xFFF43003 |
| 0xE00FE008 | Cortex-M7 CTI | 0xE0043000 | 0xFFF45000 | 4 Kbyte | 0xFFF45003 |
| 0xE00FE00C | Reserved | - | - | - | 0x1FF02002 |
| 0xE00FE010 | Top of table | - | - | - | 0x00000000 |
| 0xE00FE010 to 0xE00FEFC8 | Reserved | - | - | - | 0x00000000 |
| 0xE00FEFCC to 0xE00FEFFC | ROM table registers | - | - | - | See Table 622 |

The Cortex-M7 PPB ROM table occupies a 4-Kbyte, 32-bit wide chunk of APB-D address space, from 0xE00FF000 to 0xE00FFFC.

Table 621. Cortex-M7 PPB ROM table

| Address in ROM table | Component name | Component base address | Component address offset | Size | Entry |
|----------------------|----------------|------------------------|--------------------------|---------|------------|
| 0xE00FF000 | SCS | 0xE000E000 | 0xFFF0F000 | 4 Kbyte | 0xFFF0F003 |
| 0xE00FF004 | DWT | 0xE0001000 | 0xFFF02000 | 4 Kbyte | 0xFFF02003 |
| 0xE00FF008 | FPB | 0xE0002000 | 0xFFF03000 | 4 Kbyte | 0xFFF03003 |
| 0xE00FF00C | ITM | 0xE0000000 | 0xFFF01000 | 4 Kbyte | 0xFFF01003 |

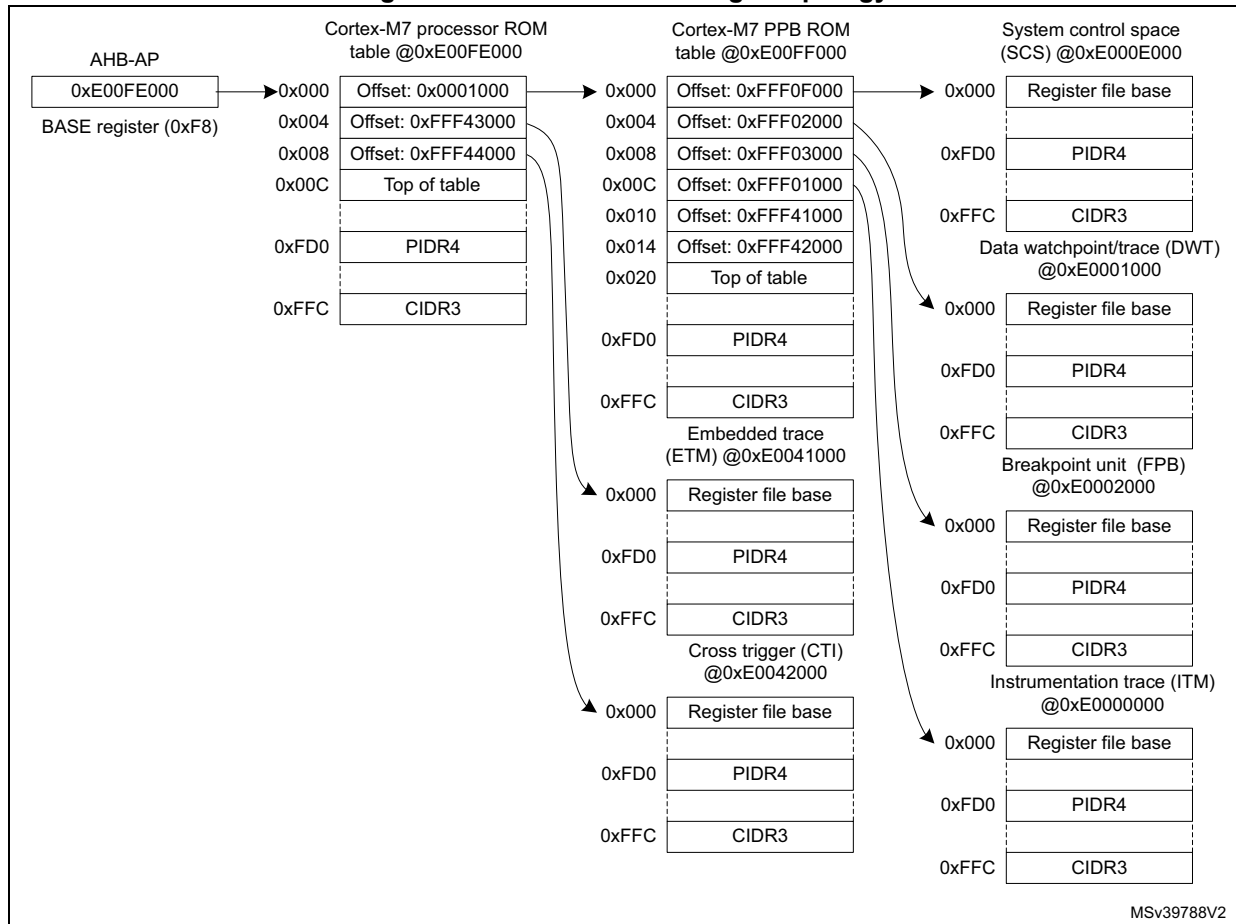

Table 621. Cortex-M7 PPB ROM table

| Address in ROM table | Component name | Component base address | Component address offset | Size | Entry |
|--------------------------|---------------------|------------------------|--------------------------|---------|-------------------------------|
| 0xE00FF010 | TPIU ⁽¹⁾ | 0xE0040000 | 0xFFF41000 | 4 Kbyte | 0xFFF41002 |
| 0xE00FF014 | ETM ⁽¹⁾ | 0xE0041000 | 0xFFF42000 | 4 Kbyte | 0xFFF42002 |
| 0xE00FF018 | Top of table | - | - | - | 0x00000000 |
| 0xE00FF01C to 0xE00FFFC8 | Reserved | - | - | - | 0x00000000 |
| 0xE00FFFC8 to 0xE00FFFC | ROM table registers | - | - | - | See Table 623 |

1. The TPIU and ETM are included in this table by default, but bit 0 is reset to indicate that they are not present.

The Topology for the CoreSight™ components in the Cortex-M7 subsystem is shown in [Figure 838](#).

60.6.2 Cortex-M7 data watchpoint and trace unit (DWT)

The DWT provides four comparators that can be used as:

- watchpoint
- ETM trigger
- PC sampling trigger
- data address sampling trigger
- data comparator (comparator 1 only)
- clock cycle counter comparator (comparator 0 only)

It also contains counters for:

- clock cycles
- folded instructions
- load store unit (LSU) operations
- sleep cycles
- number of cycles per instruction
- interrupt overhead

A DWT comparator compares one of the following with the value held in its DWT_COMP register:

- a data address
- an instruction address
- a data value
- the cycle count value, for comparator 0 only.

For address matching, the comparator can use a mask, so it matches a range of addresses.

On a successful match, the comparator generates one of the following:

- one or more DWT data trace packets, containing one or more of:
 - the address of the instruction that caused a data access
 - an address offset, bits[15:0] of the data access address
 - the matched data value
- a watchpoint debug event, on either the PC value or the accessed data address
- a CMPMATCH[N] event that signals the match outside the DWT unit

A watchpoint debug event either generates a DebugMonitor exception, or causes the processor to halt execution and enter Debug state.

For more details on how to use the DWT, refer to the Arm®v7-M Architecture Reference Manual [5].

Cortex-M7 DWT registers

DWT control register (M7_DWT_CTRL)

Address offset: 0x000

Reset value: 0x4000 0000

Bits 31:28 **NUMCOMP[3:0]**: Number of comparators implemented (read-only)

0x4: Four comparators

Bit 27 **NOTRCPKT**: Trace sampling and exception tracing support (read-only)

0: Supported

Bit 26 **NOEXTTRIG**: External match signal, CMPMATCH support (read-only)

0: Supported

Bit 25 **NOCYCCNT**: Cycle counter support (read-only)

0: Supported

- Bit 24 **NOPRFCNT**: Profiling counter support (read-only)
0: Supported
- Bit 23 Reserved, must be kept at reset value.
- Bit 22 **CYCEVTENA**: POSTCNT underflow event counter packet generation enable
0: Disabled
1: Enabled
- Bit 21 **FOLDEVTEA**: Folded instruction counter overflow event generation enable
0: Disabled
1: Enabled
- Bit 20 **LSUEVTENA**: LSU counter overflow event generation enable
0: Disabled
1: Enabled
- Bit 19 **SLEEPEVTENA**: Sleep counter overflow event generation enable
0: Disabled
1: Enabled
- Bit 18 **EXCEVTENA**: Exception overhead counter overflow event generation enable
0: Disabled
1: Enabled
- Bit 17 **CPIEVTENA**: CPI counter overflow event generation enable
0: Disabled
1: Enabled
- Bit 16 **EXCTRCENA**: Exception trace generation enable
0: Disabled
1: Enabled
- Bits 15:13 Reserved, must be kept at reset value.
- Bit 12 **PCSAMPLENA**: POSTCNT counter use enable
Enables use of POSTCNT counter as a timer for Periodic PC sample packet generation.

0: Disabled
1: Enabled
- Bits 11:10 **SYNCTAP[1:0]**: Position of synchronization packet counter tap on CYCCNT counter
This selection determines the synchronization packet rate.

0x0: Disabled - no synchronization packets
0x1: Tap at CYCCNT[24]
0x2: Tap at CYCCNT[26]
0x3: Tap at CYCCNT[28]
- Bit 9 **CYCTAP**: Position of the POSTCNT tap on the CYCCNT counter
0: Tap at CYCCNT[6]
1: Tap at CYCCNT[10]

Bits 8:5 **POSTINIT[3:0]**: Initial value of the POSTCNT counter
 Writes to this field are ignored if POSTCNT counter is enabled (that is, CYCEVTENA or PCSAMPLENA must be reset prior to writing POSTINIT).

Bits 4:1 **POSTRESET[3:0]**: Reload value of the POSTCNT counter.

Bit 0 **CYCCNTENA**: CYCCNT counter enable
 0: Disabled
 1: Enabled

DWT cycle count register (M7_DWT_CYCCNT)

Address offset: 0x004

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |

| | | | | | | | | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **CPICNT[7:0]**: CPI counter
 Counts additional cycles required to execute multi-cycle instructions, except those recorded by DWT_LSUCNT, and counts any instruction fetch stalls.

DWT exception count register (M7_DWT_EXCCNT)

Address offset: 0x00C

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|-------------|------|------|------|------|------|------|------|

| | | | | | | | | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **SLEPCNT[7:0]**: Sleep cycle counter
 Counts the number of cycles spent in sleep mode (WFI, WFE, sleep-on-exit).

DWT LSU count register (M7_DWT_LSUCNT)

Address offset: 0x014

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|-------------|------|------|------|------|------|------|------|

| | | | | | | | | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **LSUCNT[7:0]**: Load store counter

Counts additional cycles required to execute load and store instructions.

DWT fold count register (M7_DWT_FOLDCNT)

Address offset: 0x018

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|--------------|------|------|------|------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | | | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **FOLDCNT[7:0]**: Folded instruction counter

Increments on each instruction that takes 0 cycles.

DWT program counter sample register (M7_DWT_PCSR)

Address offset: 0x01C

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | | | | | | r/w | r/w | r/w | r/w | r/w |

Bits 31:5 Reserved, must be kept at reset value.

Bits 4:0 **MASK[4:0]**: Comparator mask size

Provides the size of the ignore mask applied to the access address for address range matching by comparator n. A debugger can write 0b11111 to this field and then read the register back to determine the maximum mask size supported.

DWT function register x (M7_DWT_FUNCtx)

Address offset: 0x028 + x * 0x10 (for x = 0 to 3)

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|-----------------|------|------|------|----------------|------|--------------|----------------|--------------|------|---------------|------|-----------------|-----|-----|-----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| DATAVADDR0[3:0] | | | | DATAVSIZE[1:0] | | LINK1 ENA | DATAV MATCH | CYC MATCH | Res. | EMIT RANGE | Res. | FUNCTION[3:0] | | | |
| r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | r/w | | r/w | | r/w | r/w | r/w | r/w |

Bits 31:25 Reserved, must be kept at reset value.

Bit 24 **MATCHED**: Comparator match (read-only)

Indicates if a comparator match has occurred since the register was last read.

0: No match

1: Match occurred

Bits 23:20 Reserved, must be kept at reset value.

- Bits 19:16 **DATAVADDR1[3:0]**: Comparator number of a second comparator
 When the DATAVMATCH and LNK1ENA bits are both 1, this field can hold the comparator number of a second comparator to use for linked address comparison.
- Bits 15:12 **DATAVADDR0[3:0]**: Comparator number of a comparator
 When the DATAVMATCH and LNK1ENA bits are both 1, this field can hold the comparator number of a comparator to use for linked address comparison.
- Bits 11:10 **DATAVSIZE[1:0]**: Size of required data comparison
 For data value matching, specifies the size of the required data comparison.

 0x0: Byte
 0x1: Half word
 0x2: Word
 0x3: Reserved
- Bit 9 **LNK1ENA**: Support of a second linked comparator (read-only)
 Indicates whether the use of a second linked comparator is supported (read-only).

 1: Supported
- Bit 8 **DATAVMATCH**: Cycle comparison enable
 0: Perform address comparison
 1: Perform data value comparison
- Bit 7 **CYCMATCH**: Cycle count comparison enable on comparator 0
 This field is reserved for other comparators.

 0: No cycle count comparison
 1: Compare DWT_COMP0 with the cycle counter, DWT_CYCCNT
- Bit 6 Reserved, must be kept at reset value.
- Bit 5 **EMITRANGE**: Data trace address offset packet enable
 Enables generation of data trace address offset packets (containing data address bits 0 to 15)
 0: Disabled
 1: Enabled
- Bit 4 Reserved, must be kept at reset value.
- Bits 3:0 **FUNCTION[3:0]**: Action on comparator match
 The meaning of this bit field depends on the setting of the DATAVMATCH and CYCMATCH fields. See [5].

DWT CoreSight peripheral identity register 4 (M7_DWT_PIDR4)

Address offset: 0xFD0

Reset value: 0x0000 0004

60.6.3 Cortex-M7 instrumentation trace macrocell (ITM)

The ITM generates trace information as packets. There are four sources that can generate packets. If multiple sources generate packets at the same time, the ITM arbitrates the order in which packets are output. The four sources in decreasing order of priority are:

1. Software trace

Software can write directly to any of 32 x 32-bit ITM stimulus registers to generate packets. The permission level for each port can be programmed. When software writes to an enabled stimulus port, the ITM combines the identity of the port, the size of the write access, and the data written, into a packet that it writes to a FIFO. The ITM

outputs packets from the FIFO onto the trace bus. Reading a stimulus port register returns the status of the stimulus register (empty or pending) in bit 0.

2. Hardware trace

The DWT generates trace packets in response to a data trace event, a PC sample or a performance profiling counter wraparound. The ITM outputs these packets on the trace bus.

3. Local timestamping

The ITM contains a 21-bit counter clocked by the (pre-divided) processor clock. The counter value is output in a timestamp packet on the trace bus. The counter is reset to zero every time a timestamp packet is generated. The timestamps thus indicate the time elapsed since the previous timestamp packet.

4. Global system timestamping

Timestamps can also be generated using the system-wide 64-bit count value coming from the Timestamp Generator component.

Cortex-M7 ITM registers

ITM stimulus register x (M7_ITM_STIMx)

Address offset: 0x000 + x * 0x4 (x = 0 to 31)

Reset value: Undefined

Bits 31:0 **STIMULUS[31:0]**: Software event packet / FIFOREADY

Write data is output on the trace bus as a software event packet. When reading, bit 0 is a FIFOREADY indicator:

- 0: Stimulus port buffer is full (or port is disabled)
- 1: Stimulus port can accept new write data

ITM trace enable register (M7_ITM_TER)

Address offset: 0xE00

Reset value: 0x00000000

Bits 31:0 **STIMENA[31:0]**: Stimulus port enable

Each bit n (0:31) enables the stimulus port associated with the M7_ITM_STIMn register.

- 0: Port disabled
- 1: Port enabled

ITM trace privilege registers (M7_ITM_TPR)

Address offset: 0xE40

Reset value: 0x00000000

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **PRIVMASK[3:0]**: Enable unprivileged access to ITM stimulus ports

Each bit controls eight stimulus ports:

- 0bXXX0: Unprivileged access permitted on ports 0 to 7
- 0bXXX1: Only privileged access permitted on ports 0 to 7
- 0bXX0X: Unprivileged access permitted on ports 8 to 15
- 0bXX1X: Only privileged access permitted on ports 8 to 15
- 0bX0XX: Unprivileged access permitted on ports 16 to 23
- 0bX1XX: Only privileged access permitted on ports 16 to 23
- 0b0XXX: Unprivileged access permitted on ports 24 to 31
- 0b1XXX: Only privileged access permitted on ports 24 to 31

ITM trace control register (M7_ITM_TCR)

Address offset: 0xE80

Reset value: 0x0000 0000

| | | | | r/w | r/w | r/w | r/w | | | | r | r/w | r/w | r/w | r/w |

Bits 31:24 Reserved, must be kept at reset value.

Bit 23 **BUSY**: ITM busy

Indicates whether the ITM is currently processing events (read-only):

0: Not busy

1: Busy

Bits 22:16 **TRACEBUSID[6:0]**: Identifier for multi-source trace stream formatting

If multi-source trace is in use, the debugger must write a non-zero value to this field. Note: different IDs must be used for each trace source in the system.

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:10 **GTSFREQ[1:0]**: Global timestamp frequency

Defines how often the ITM generates a global timestamp, based on the global timestamp clock frequency, or disables generation of global timestamps. The possible values are:

0x0: Disable generation of global timestamps

0x1: Generate timestamp request whenever the ITM detects a change in global timestamp counter bits [63:7]; this is approximately every 128 cycles

0x2: Generate timestamp request whenever the ITM detects a change in global timestamp counter bits [63:13]; this is approximately every 8192 cycles

0x3: Generate a timestamp after every packet, if the output FIFO is empty

Bits 9:8 **TSPRESCALE[1:0]**: Local timestamp prescale

Prescale used with the trace packet reference clock The possible values are:

0x0: No prescaling

0x1: Divide by 4

0x2: Divide by 16

0x3: Divide by 64

Bits 7:5 Reserved, must be kept at reset value.

Bit 4 **SWOENA**: Asynchronous clocking enable for the timestamp counter (read-only)

0: Timestamp counter uses processor clock

Bit 3 **TXENA**: Hardware event packet forwarding enable

Enables forwarding of hardware event packets from the DWT unit to the trace port.

0: Disabled

1: Enabled

Bit 2 **SYNCENA**: Synchronization packet transmission enable

If a debugger sets this bit it must also configure the DWT_CTRL register SYNCTAP field in the DWT for the correct synchronization speed.

0: Disabled

1: Enabled

Bit 1 **TSENA**: Local timestamp generation enable

0: Disabled

1: Enabled

Bit 0 **ITMENA**: ITM enable

0: Disabled

1: Enabled

ITM CoreSight peripheral identity register 4 (M7_ITM_PIDR4)

60.6.4 Cortex-M7 breakpoint unit (FPB)

The FPB allows hardware breakpoints to be set. It contains eight comparators which monitor the instruction fetch address and return a breakpoint instruction when a match is detected. The Cortex-M7 FPB does not support flash patch functionality.

Cortex-M7 FPB registers

FPB control register (M7_FPB_CTRL)

Address offset: 0x000

Reset value: 0x0000 0080

| | | | | | | | | | | | | | | | |
|------|---------------|------|------|--------------|------|------|------|---------------|------|------|------|------|------|------|---------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |

| Res. | NUM_CODE[6:4] | | | NUM_LIT[3:0] | | | | NUM_CODE[3:0] | | | | Res. | Res. | KEY | ENABL E |
| | r | r | r | r | r | r | r | r | r | r | r | | | r/w | r/w |

Bits 31:15 Reserved, must be kept at reset value.

Bits 14:12 **NUM_CODE[6:4]**: Instruction address comparator number field, three MSBs
 This read-only field holds the three MSBs of the number of instruction address comparators supported.

0x0: the MSBs of the number are all 0

Bits 11:8 **NUM_LIT[3:0]**: Number of literal address comparators supported (read-only).
 0x0: No literal comparators supported.

Bits 7:4 **NUM_CODE[3:0]**: Instruction address comparator number field, four LSBs
 This read-only field holds the four LSBs of the number of instruction address comparators supported.

0x8: 8 instruction comparators supported

Bit 1 **KEY**: Write protect key
 A write to M7_FPB_CTRL register is ignored if this bit is not set to 1.

Bits 0 **ENABLE**: FPB enable
 0: Disable
 1: Enable

FPB remap register (M7_FPB_REMAP)

Address offset: 0x004

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|-------------|------|------------|--------------|----|----|----|----|----|----|----|------|------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | RMPS PT | REMAP[23:11] | | | | | | | | | | | | |

| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | | | | | |

Bits 31:30 Reserved, must be kept at reset value.

Bit 29 **RMPSPT**: Flash patch remap support (read-only)
 0: Remapping not supported

Bits 28:5 **REMAP[23:0]**: Reserved - not supported

Bits 4:0 Reserved, must be kept at reset value.

FPB comparator registers (M7_FPB_COMPx)

Address offset: 0x008 + x * 0x4 (for x = 0 to 7)

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|--------------|----|------|-------------|----|----|----|----|----|----|----|----|----|------|------------|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| REPLACE[1:0] | | Res. | COMP[26:14] | | | | | | | | | | | | |
| rw | rw | | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| COMP[13:0] | | | | | | | | | | | | | Res. | ENAB LE | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | | rw |

Bits 31:30 **REPLACE[1:0]**: Behavior upon COMP versus instruction fetch address match
 Defines the behavior when a match occurs between the COMP field and the instruction fetch address:

- 0x0: Reserved
- 0x1: Breakpoint on lower half-word, upper half-word is unaffected.
- 0x2: Breakpoint on upper half-word, lower half-word is unaffected.
- 0x3: Breakpoint on both upper and lower half-words.

Bit 29 Reserved, must be kept at reset value.

Bits 28:2 **COMP[26:0]**: Value to compare with code memory access address
 Value to compare with address bits 28:2 of accesses to instruction code memory (0x00000000 to 0x1FFFFFFF). If a match occurs, the action to take is defined by the REPLACE field.

Bit 1 Reserved, must be kept at reset value.

Bit 0 **ENABLE**: Comparator enable
 The comparator is only enabled if both this bit and the FPB ENABLE bit in the M7_FPB_CTRL register are set.

- 0: Disabled
- 1: Enabled

FPB CoreSight peripheral identity register 4 (M7_FPB_PIDR4)

Address offset: 0xFD0

Reset value: 0x0000 0004

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|--------------|------|------|------|----------------|------|------|------|

60.6.5 Cortex-M7 embedded trace macrocell (ETM)

The Cortex-M7 ETM is a CoreSight™ component closely coupled to the CPU. The ETM generates trace packets that allow the execution of the Cortex-M7 core to be traced. In the STM32H7, the ETM is configured for instruction trace only, so data accesses are not included in the trace information.

The ETM receives information from the CPU over the processor trace interface, including:

- The number of instructions executed in the same cycle
- Changes in program flow
- The current processor instruction state
- The addresses of memory locations accessed by load and store instructions
- The type, direction and size of a transfer
- Condition code information
- Exception information
- Wait for interrupt state information

For more information, refer to the Arm® CoreSight™ ETM™-M7 technical reference manual [6].

Cortex-M7 ETM registers

ETM programming control register (M7_ETM_PRGCTL)

Address offset: 0x004

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |

| | | | | | | | | | | | | | | r | r |

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **PMSTABLE**: Programmers model stable

Indicates whether the ETM registers are stable and can be read.

0: Registers are not stable

1: Registers are stable

Bit 0 **IDLE**: Trace unit inactive

0: ETM is not idle

1: ETM is idle

ETM trace configuration register (M7_ETM_CONFIG)

Address offset: 0x010

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|-----------|------|------|------|------|------|------|------|-------------|----|------|

| | | | rw | rw | rw | rw | rw | | | | rw | rw | r | r | |

Bits 31:18 Reserved, must be kept at reset value.

Bit 17 **DV**: Data value tracing (read-only)
0: Disabled

Bit 16 **DA**: Data address tracing (read-only)
0: Disabled

Bits 15:13 Reserved, must be kept at reset value.

Bit 12 **RS**: Return stack enable
0: Disabled
1: Enabled

Bit 11 **TS**: Global timestamp tracing
0: Disabled
1: Enabled

Bits 10:8 **COND[2:0]**: Conditional instruction tracing
0x0: Conditional instruction tracing disabled
0x1: Conditional load instructions are traced
0x2: Conditional store instructions are traced
0x3: Conditional load and store instructions are traced
0x7: All conditional instructions are traced
Other: Reserved

Bits 7:5 Reserved, must be kept at reset value.

Bit 4 **CCI**: Cycle counting in instruction trace
0: Disabled
1: Enabled

Bit 3 **BB**: Branch broadcast mode
0: Disabled
1: Enabled

Bits 2:1 **INSTP0[1:0]**: Determines which instructions are P0 instructions (read-only)
0x0: Only branches are P0 instructions

Bit 0 Reserved, must be kept at reset value.

ETM event control 0 register (M7_ETM_EVENTCTL0)

Only accepts writes when trace unit is disabled

Address offset: 0x020

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|-------|------|------|------|-----------|------|------|------|-------|------|------|------|-----------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| rw | | | | rw | rw | rw | rw | rw | | | | rw | rw | rw | rw |

Bits 31:16 Reserved, must be kept at reset value.

Bit 15 **TYPE1**: Resource type for event 1
 0: Single selected resource
 1: Boolean combined resource pair

Bits 14:12 Reserved, must be kept at reset value.

Bits 11:8 **SEL1[3:0]**: Resource / Boolean combined resource pair, for event 1
 When TYPE1 is 0, selects a single selected resource from 0-15 defined by bits[3:0]
 When TYPE1 is 1, selects a Boolean combined resource pair from 0-7 defined by bits[2:0]

Bit 7 **TYPE0**: Resource type for event 0
 0: Single selected resource
 1: Boolean combined resource pair

Bits 6:4 Reserved, must be kept at reset value.

Bits 3:0 **SEL0[3:0]**: Resource / Boolean combined resource pair for event 0
 When TYPE0 is 0, selects a single selected resource from 0-15 defined by bits[3:0]
 When TYPE0 is 1, selects a Boolean combined resource pair from 0-7 defined by bits[2:0]

ETM event control 1 register (M7_ETM_EVENTCTL1)

Only accepts writes when trace unit is disabled

Address offset: 0x024

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------|------|------|----------------|------|------|------|------|------|------|------|------|-------------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |

| Res. | Res. | Res. | LPOVE RRIDE | ATB | Res. | Res. | Res. | Res. | Res. | Res. | Res. | INSTEN[3:0] | | | |
| | | | rw | rw | | | | | | | | rw | rw | rw | rw |

Bits 31:13 Reserved, must be kept at reset value.

Bit 12 **LPOVERRIDE**: Low power state behavior override

0: Low power state normal behavior

1: Entry to low power state does not affect resources and event trace generation

Bit 11 **ATB**: ATB trigger enable

0: Disabled

1: Enabled

Bits 10:4 Reserved, must be kept at reset value.

Bits 3:0 **INSTEN[3:0]**: Instruction trace event element enable

Each bit corresponds to an event:

0bXXX0: Event 0 does not cause an event element

0bXXX1: Event 0 causes an event element

0bXX0X: Event 1 does not cause an event element

0bXX1X: Event 1 causes an event element

0bX0XX: Event 2 does not cause an event element

0bX1XX: Event 2 causes an event element

0b0XXX: Event 3 does not cause an event element

0b1XXX: Event 3 causes an event element

ETM stall control register (M7_ETM_STALLCTL)

Only accepts writes when trace unit is disabled

Address offset: 0x02C

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|--------|--------|------|------|------|------|------------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |

| Res. | Res. | Res. | Res. | Res. | Res. | DSTALL | ISTALL | Res. | Res. | Res. | Res. | LEVEL[1:0] | | Res. | Res. |
| | | | | | | rw | rw | | | | | rw | rw | | |

Bits 31:10 Reserved, must be kept at reset value.

Bit 9 **DSTALL**: Stall processor based on data trace buffer space

0: Do not stall processor

1: Stall processor

Bit 8 **ISTALL**: Stall processor based on instruction trace buffer space

0: Do not stall processor

1: Stall processor

Bits 7:4 Reserved, must be kept at reset value.

Bits 3:2 **LEVEL[1:0]**: Stalling threshold level

A low level minimizes the amount of processor stalling, with a higher risk of FIFO overflow. A high level minimizes the risk of FIFO overflow but increases the amount of processor stalling.

Bits 1:0 Reserved, must be kept at reset value.

ETM global timestamp control register (M7_ETM_TSCTL)

Only accepts writes when trace unit is disabled

Address offset: 0x030

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|------|------|------|------|----------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |

| | | | | | | | | rw | | | | rw | rw | rw | rw |

Bits 31:8 Reserved, must be kept at reset value.

Bit 7 **TYPE**: Resource type for time stamp insertion

- 0: Single selected resource
- 1: Boolean combined resource pair

Bits 6:4 Reserved, must be kept at reset value.

Bits 3:0 **SEL[3:0]**: Resource / Boolean combined resource pair

- When TYPE is 0, selects a single selected resource from 0-15 defined by bits[3:0]
- When TYPE is 1, selects a Boolean combined resource pair from 0-7 defined by bits[2:0]

ETM synchronization period register (M7_ETM_SYNCP)

Address offset: 0x034

Reset value: 0x0000 000A

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|------|------|------|-------------|------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |

| | | | | | | | | | | | r | r | r | r | r |

Bits 31:5 Reserved, must be kept at reset value.

Bits 4:0 **PERIOD[4:0]**: Trace bytes between synchronization requests

- Defines the number of bytes of trace information between trace synchronization requests.
- 0xA: 1024 bytes

ETM cycle count control register (M7_ETM_CCCTL)

Address offset: 0x038

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------|------|------|------|-----------------|------|------|------|------|------|------|------|------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | THRESHOLD[11:0] | | | | | | | | | | | |
| | | | | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:0 **THRESHOLD[11:0]**: Threshold value for instruction trace cycle counting
 The threshold represents the minimum interval between cycle count trace packets.
 0x0: Reserved
 Other: Threshold

ETM trace ID register (M7_ETM_TRACEID)

Address offset: 0x040

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|------|--------------|------|------|------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | TRACEID[6:0] | | | | | | |
| | | | | | | | | | rw | rw | rw | rw | rw | rw | rw |

Bits 31:7 Reserved, must be kept at reset value.

Bits 6:0 **TRACEID[6:0]**: Trace ID
 0x00: Reserved
 0x01 to 0x6F: Valid ID
 0x70 to 0x7F: Reserved

ETM ViewInst main control register (M7_ETM_VICTL)

Address offset: 0x080

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------|------|------|------|------------|--------------|--------------|------|------|------|------|------|----------------|------|------|----------------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | EXLEV EL_S3 | Res. | Res. | EXLEV EL_S0 |
| | | | | | | | | | | | | rw | | | rw |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | TRCE RR | TRCR ESET | SSSTA TUS | Res. | TYPE | Res. | Res. | Res. | SEL[3:0] | | | |
| | | | | rw | rw | rw | | rw | | | | rw | rw | rw | rw |

Bits 31:20 Reserved, must be kept at reset value.

Bit 19 **EXLEVEL_S3**: Trace disable, exception level 3

Disables tracing in the specified exception level in Secure state for exception level 3.

0: Enable ViewInst in this exception level

1: Disable ViewInst in this exception level

Bits 18:17 Reserved, must be kept at reset value.

Bit 16 **EXLEVEL_S0**: Trace disable, exception level 0

Disables tracing in the specified exception level in Secure state for exception level 0.

0: Enable ViewInst in this exception level

1: Disable ViewInst in this exception level

Bits 15:12 Reserved, must be kept at reset value.

Bit 11 **TRCERR**: Tracing of system error exception

Selects whether a system error exception must always be traced.

0: System error exception is traced only if the instruction or exception immediately before the system error exception is traced

1: System error exception is always traced regardless of the value of ViewInst

Bit 10 **TRCRESET**: Tracing of reset exception

Selects whether a reset exception must always be traced.

0: Reset exception is traced only if the instruction or exception immediately before the reset exception is traced

1: Reset exception is always traced regardless of the value of ViewInst

Bit 9 **SSSTATUS**: Current status of the start/stop logic

0: Stop state

1: Started state

Bit 8 Reserved, must be kept at reset value.

Bit 7 **TYPE**: Resource type
 0: Single selected resource
 1: Boolean combined resource pair

Bits 6:4 Reserved, must be kept at reset value.

Bits 3:0 **SEL[3:0]**: Resource / Boolean combined resource pair
 When TYPE is 0, selects a single selected resource from 0-15 defined by bits[3:0]
 When TYPE is 1, selects a Boolean combined resource pair from 0-7 defined by bits[2:0]

ETM ViewInst start/stop control register (M7_ETM_VISSCTL)

Address offset: 0x088

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|------------|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | | | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:16 **STOP[7:0]**: Selector of single address comparators to stop trace
 Defines the single address comparators to stop trace with the ViewInst Start/Stop control.
 One bit is provided for each implemented single address comparator.

Bits 15:8 Reserved, must be kept at reset value.

Bits 7:0 **START[7:0]**: Selector of single address comparators to start trace
 Defines the single address comparators to start trace with the ViewInst Start/Stop control.
 One bit is provided for each implemented single address comparator.

ETM ViewInst start/stop processor comparator control register (M7_ETM_VIPCSSCTL)

Address offset: 0x08C

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|------|------|------|------|------------|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | | | | | | | rw | rw | rw | rw |

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:16 **STOP[3:0]**: Selector of processor comparator input to stop trace
 Selects which processor comparator inputs are in use with ViewInst start-stop control, for the purpose of stopping trace. One bit is provided for each processor comparator input.

Bits 15:4 Reserved, must be kept at reset value.

Bits 3:0 **START[3:0]**: Selector of processor comparator input to start trace
 Selects which processor comparator inputs are in use with ViewInst start-stop control, for the purpose of starting trace. One bit is provided for each processor comparator input.

ETM counter reload value register (M7_ETM_CNTRLDV)

Address offset: 0x140

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|-------------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| VALUE[15:0] | | | | | | | | | | | | | | | |
| rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **VALUE[15:0]**: Counter reload value
 This value is loaded into the counter each time the reload event occurs.

ETM ID register 8 (M7_ETM_IDR8)

Address offset: 0x180

Reset value: 0x0000 0002

| | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| MAXSPEC[31:16] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| MAXSPEC[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:0 **MAXSPEC[31:0]**: Maximum speculation depth
 Indicates the maximum speculation depth of the instruction trace stream. This is the maximum number of P0 elements that have not been committed in the trace stream at any one time.
 0x2: Maximum trace speculation depth is 2

ETM ID register 9 (M7_ETM_IDR9)

Address offset: 0x184

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|-----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| NUMP0KEY[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:0 **NUMP0KEY[31:0]**: Number of P0 right-hand keys used
 0x0: No P0 keys used in instruction trace only configuration

ETM ID register 10 (M7_ETM_IDR10)

Address offset: 0x188

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|-----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| NUMP1KEY[31:16] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| NUMP1KEY[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:0 **NUMP1KEY[31:0]**: Total number of P1 right-hand keys
 Indicates the total number of P1 right-hand keys, including normal and special keys.
 0x0: No P1 keys used in instruction trace only configuration

ETM ID register 11 (M7_ETM_IDR11)

Address offset: 0x18C

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |

| r | | r | r | r | r | r | r | r | r | | | | | | | |

Bits 31:30 Reserved, must be kept at reset value.

Bit 29 **COMMOPT**: Meaning of the commit field in some packets
 0: Commit mode 0

Bits 28:24 **TSSIZE[4:0]**: Global timestamp size
 0x08: Maximum of 64-bit global timestamp implemented

Bits 23:17 Reserved, must be kept at reset value.

Bits 16:15 **QSUPP[1:0]**: Q element support
 0x0: Q elements not supported

Bit 14 Reserved, must be kept at reset value.

Bits 13:12 **CONDTYPE[1:0]**: Conditional result tracing type
 0x1: APSR condition flag values traced

Bits 11:10 **NUMEVENT[1:0]**: Number of events supported in the trace
 0x1: Two events supported for instruction only configuration

Bit 9 **RETSTACK**: Return stack support
 1: Two entry return stack supported

Bit 8 Reserved, must be kept at reset value.

Bit 7 **TRCCCI**: Support for cycle counting in the instruction trace
 1: Cycle counting in the instruction trace is implemented

Bit 6 **TRCCOND**: Support for conditional instruction tracing
 1: Conditional instruction trace is implemented

Bit 5 **TRCBB**: Support for branch broadcast tracing
 1: Branch broadcast trace is implemented

Bits 4:0 Reserved, must be kept at reset value.

ETM ID register 1 (M7_ETM_IDR1)

Address offset: 0x1E4

Reset value: 0x4100 F401

Bits 31:24 **DESIGNER[7:0]**: Trace unit designer entity
0x41: Arm®

Bits 23:12 Reserved, must be kept at reset value.

Bits 11:8 **TRCARCHMAJ[3:0]**: Major trace unit architecture version number
0x4: ETM v4

Bits 7:4 **TRCARCHMIN[3:0]**: Minor trace unit architecture version number
0x0: Minor version 0

Bits 3:0 **REVISION[3:0]**: Implementation revision number
0x1: Rev 1

ETM ID register 2 (M7_ETM_IDR2)

Address offset: 0x1E8

Reset value: 0x0000 0004

| | | | | | | | | | | | | | | | |
|-----------|---------------|------|-------------|----|--------------|----|-------------|----|-------------|----|-------------|----|----|----|----|

Bits 31:29 Reserved, must be kept at reset value.

Bits 28:25 **CCSIZE[3:0]**: Cycle counter size
Indicates the size of the cycle counter in bits minus 12.
0x0: Cycle counter is 12 bits

Bits 24:20 **DVSIZE[4:0]**: Data value size in bytes
0x0: Data value size is not supported in instruction only configuration

Bits 19:15 **DASIZE[4:0]**: Data address size in bytes
0x0: Data address size is not supported in instruction only configuration

Bits 14:10 **VMIDSIZE[4:0]**: Virtual machine ID size
 0x0: Virtual machine ID tracing not implemented

Bits 9:5 **CIDSIZE[4:0]**: Context ID size
 0x0: Context ID tracing not implemented

Bits 4:0 **IASIZE[4:0]**: Instruction address size
 0x4: 32-bit maximum address size

ETM ID register 3 (M7_ETM_IDR3)

Address offset: 0x1EC

Reset value: 0x0509 0004

| | | | | | | | | | | | | | | | |
|-------------------|--------------|------|------|---------------|--------------|------------|------------|------|------|------|------|----------------|----|----|----|

Bit 31 **NOOVERFLOW**: Support of NOOVERFLOW
 Indicates whether the NOOVERFLOW of trace stall control is implemented.
 0: Not implemented

Bits 30:28 **NUMPROC[2:0]**: Number of processors available for tracing
 0x0: Only one processor can be traced

Bit 27 **SYSSTALL**: System support for stall control of the processor
 0: Not supported

Bit 26 **STALLCTL**: Stall control support
 1: Trace stall control (TRCSTALLCTLR) is implemented

Bit 25 **SYNCP R**: Trace synchronization period support
 0: TRCSYNCP R is read-only for instruction trace only configuration; the trace synchronization period is fixed

Bit 24 **TRCERR**: Support of TRCVICTLR.TRCERR
 Indicates whether TRCVICTLR.TRCERR is implemented.
 0x4: 32-bit maximum address size

Bits 23:20 Reserved, must be kept at reset value.

Bits 19:16 **EXLEVEL_S[3:0]**: Support of privilege levels
 Privilege levels are implemented; one bit for each level.
 0x9: Privilege levels Thread and Handler are implemented

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:0 **CCITMIN[11:0]**: Instruction trace cycle counting minimum threshold
 0x4: Minimum threshold is 4 instruction trace cycle

ETM ID register 4 (M7_ETM_IDR4)

Address offset: 0x1F0

Reset value: 0x0001 4000

Bits 31:28 **NUMVMIDC[3:0]**: Number of Virtual Machine ID comparators implemented
0x0: None

Bits 27:24 **NUMCIDC[3:0]**: Number of Context ID comparators implemented
0x0: None

Bits 23:20 **NUMSSCC[3:0]**: Number of single-shot comparator controls implemented
0x0: None

Bits 19:16 **NUMRSPAIR[3:0]**: Number of resource selection pairs implemented
0x1: None

Bits 15:12 **NUMPC[3:0]**: Number of processor comparator inputs implemented
0x4: Four

Bits 11:9 Reserved, must be kept at reset value.

Bit 8 **SUPPADC**: Support of data address comparisons
0: Not implemented

Bits 7:4 **NUMDVC[3:0]**: Number of data value comparators implemented
0x0: None

Bits 3:0 **NUMACPAIRS[3:0]**: Number of address comparator pairs implemented.
0x0: None

ETM ID register 5 (M7_ETM_IDR5)

Address offset: 0x1F4

Reset value: 0x90C7 0402

- Bit 31 **REDFUNCNTR**: Support of reduced function counter
1: Implemented
- Bits 30:28 **NUMCNTR[2:0]**: Number of counters implemented
0x1: One counter implemented
- Bits 27:25 **NUMSEQSTATE[2:0]**: Number of sequencer states implemented
0x0: None
- Bit 24 Reserved, must be kept at reset value.
- Bit 23 **LPOVERRIDE**: Support of low-power state override
1: Implemented
- Bit 22 **ATBTRIG**: Support of ATB trigger
1: Implemented
- Bits 21:16 **TRACEIDSIZE[5:0]**: Number of trace ID bits
0x07: Seven-bit trace ID implemented.
- Bits 15:12 Reserved, must be kept at reset value.
- Bits 11:9 **NUMEXTINSEL[2:0]**: Number of implemented external input selectors
0x2: Two external input selectors implemented
- Bits 8:0 **NUMEXTIN[8:0]**: Number of implemented external inputs
0x2: Two external inputs implemented

ETM resource selection register 2 (M7_ETM_RSCTL2)

Address offset: 0x208

Reset value: 0x0000 0000

- Bits 31:22 Reserved, must be kept at reset value.
- Bit 21 **PAIRINV**: Inversion of result of a combined pair of resources
0: Not inverted
1: Inverted
- Bit 20 **INV**: Inversion of the selected resources
0: Not inverted
1: Inverted
- Bit 19 Reserved, must be kept at reset value.

Bits 18:16 **GROUP[2:0]**: Selects a group of resources

Bits 15:8 Reserved, must be kept at reset value.

Bits 7:0 **SELECT[7:0]**: Selector of resources from desired group

Selects one or more resources from the desired group. One bit is provided per resource from the group.

ETM resource selection register 3 (M7_ETM_RSCTL3)

Address offset: 0x20C

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | | | |

Bits 31:21 Reserved, must be kept at reset value.

Bit 20 **INV**: Inversion of the selected resources

- 0: Not inverted
- 1: Inverted

Bit 19 Reserved, must be kept at reset value.

Bits 18:16 **GROUP[2:0]**: Selects a group of resources

Bits 15:8 Reserved, must be kept at reset value.

Bits 7:0 **SELECT[7:0]**: Selector of resources from desired group

Selects one or more resources from the desired group. One bit is provided per resource from the group.

ETM single-shot comparator control register 0 (M7_ETM_SSCC0)

Address offset: 0x280

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|

| | | | | | | | | | | | | | | | |

Bits 31:25 Reserved, must be kept at reset value.

Bit 24 **RST**: Single-shot comparator resource reset enable

Enables the single-shot comparator resource to be reset when it occurs, then enables another comparator match to be detected.

0: Disabled

1: Reset enabled; multiple matches can occur

Bits 23:0 Reserved, must be kept at reset value.

ETM single-shot comparator status register 0 (M7_ETM_SSCS0)

Address offset: 0x2A0

Reset value: 0x0000 0001

| | | | | | | | | | | | | | | | |
|--------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | | | | | | | | r | r | r |

Bit 31 **STATUS**: Single-shot status

This indicates whether any of the selected comparators have matched. If SSCC0.RST is set to 0, the STATUS bit must be written with 0 in order to enable single-shot comparator control.

0: No match occurred

1: Match has occurred at least once.

Bits 30:3 Reserved, must be kept at reset value.

Bit 2 **DV**: Data value comparator support

0: Single-shot data value comparisons not supported

Bit 1 **DA**: Data address comparator support

0: Single-shot data address comparisons not supported

Bit 0 **INST**: Instruction address comparator support

1: Single-shot instruction address comparisons supported

ETM single-shot processor comparator input control register (M7_ETM_SSPCIC0)

| | | | | | | | | | | | | r | | | |

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **PU**: Power up request

Request to maintain power to the ETM and access to the trace registers.

0: Power not requested

1: Power requested

Bits 2:0 Reserved, must be kept at reset value.

ETM power-down status register (M7_ETM_PDS)

Address offset: 0x314

Reset value: 0x0000 0003

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|-----------|-------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | | | | | | | | | | | r | r |

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **STICKYPD**: Sticky power-down state

This bit is set to 1 when power to the ETM registers is removed, to indicate that programming state has been lost. It is cleared after a read of the TRCPDSR.

0: Trace register power uninterrupted since the last read of PDS register

1: Trace register power interrupted since the last read of PDS register

Bit 0 **POWER**: ETM powered up

1: ETM is powered up; all registers are accessible

ETM claim tag set register (M7_ETM_CLAIMSET)

Address offset: 0xFA0

Reset value: 0x0000 000F

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|------|------|------|------|---------------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| | | | | | | | | | | | | | | | |

| | | | | | | | | | | | | r | r | r | r |

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CLAIMSET[3:0]**: Set claim tag bits

Write:

0000: No effect

xxx1: Set bit 0

xx1x: Set bit 1

x1xx: Set bit 2

1xxx: Set bit 3

Read:

0xF: Indicates there are four bits in claim tag

ETM claim tag clear register (M7_ETM_CLAIMCLR)

Address offset: 0xFA4

Reset value: 0x0000 0000

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|------|------|------|------|---------------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |

| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | CLAIMCLR[3:0] | | | |
| | | | | | | | | | | | | rw | rw | rw | rw |

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CLAIMCLR[3:0]**: Reset claim tag bits

Write:

0000: No effect

xxx1: Clear bit 0

xx1x: Clear bit 1

x1xx: Clear bit 2

1xxx: Clear bit 3

Read: Returns current value of claim tag

ETM lock access register (M7_ETM_LAR)

Address offset: 0xFB0

Reset value: N/A

| | | | | | | | | | | | | | | | |
|-----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| ACCESS_W[31:16] | | | | | | | | | | | | | | | |
| w | w | w | w | w | w | w | w | w | w | w | w | w | w | w | w |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| ACCESS_W[15:0] | | | | | | | | | | | | | | | |
| w | w | w | w | w | w | w | w | w | w | w | w | w | w | w | w |

Bits 31:0 **ACCESS_W[31:0]**: ETM register write access

Enables write access to some ETM registers by processor cores (debuggers do not need to unlock the component)

0xC5ACCE55: Enable write access

Other values: Disable write access

ETM lock status register (M7_ETM_LSR)

Address offset: 0xFB4

Reset value: 0x0000 0003

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|------|------|------|------|------|--------------|---------------|---------------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | LOCKT YPE | LOCKG RANT | LOCKE XIST |
| | | | | | | | | | | | | | r | r | r |

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **LOCKTYPE**: Size of the M7_ETM_LAR register
0: 32-bit

Bit 1 **LOCKGRANT**: Current status of lock
This bit always returns zero when read by an external debugger.

0: Write access is permitted
1: Write access is blocked. Only read access is permitted.

Bit 0 **LOCKEXIST**: Existence of lock control mechanism
The bit indicates whether a lock control mechanism exists. It always returns zero when read by an external debugger.

0: No lock control mechanism exists
1: Lock control mechanism is implemented

ETM authentication status register (M7_ETM_AUTHSTAT)

Address offset: 0xFB8

Reset value: 0x0000 000A

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|-----------|------|----------|------|------------|------|-----------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | SNID[1:0] | | SID[1:0] | | NSNID[1:0] | | NSID[1:0] | |
| | | | | | | | | r | r | r | r | r | r | r | r |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:6 **SNID[1:0]**: Security level for secure non-invasive debug
0x0: Not implemented

Bits 5:4 **SID[1:0]**: Security level for secure invasive debug
 0x0: Not implemented

Bits 3:2 **NSNID[1:0]**: Security level for non-secure non-invasive debug
 0x2: Disabled
 0x3: Enabled

Bits 1:0 **NSID[1:0]**: Security level for non-secure invasive debug
 0x2: Disabled
 0x3: Enabled

ETM CoreSight device architecture register (M7_ETM_DEVARCH)

Address offset: 0xFBC

Reset value: 0x4770 4A13

| | | | | | | | | | | | | | | | |
|-----------------|----|----|----|----|----|----|----|----|----|----|---------|---------------|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| ARCHID[15:0] | | | | | | | | | | | | | | | |
| r | r | r | r | r | r | r | r | r | r | r | r | r | r | r | r |

Bits 31:21 **ARCHITECT[10:0]**: Component architect
 0x23B: Arm®

Bit 20 **PRESENT**: Indicates the presence of this register
 1: Present

Bits 19:16 **REVISION[3:0]**: Architecture revision
 0x0: Rev 0

Bits 15:0 **ARCHID[15:0]**: Architecture ID
 0x4A13: ETMv4 component

ETM CoreSight device type identity register (M7_ETM_DEVTYPE)

Address offset: 0xFCC

Reset value: 0x0000 0013

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|--------------|------|------|------|----------------|------|------|------|

 0xB1: Common ID value

Cortex-M7 ETM register map and reset values

The ETM registers are accessed by the debugger via the Cortex-M7 PPB, at address range 0xE0041000 to 0xE0041FFC.

Table 627. Cortex-M7 ETM register map and reset values

| Offset | Register name | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |

61 Device electronic signature

The electronic signature is stored in the Flash memory area. It can be read using the JTAG/SWD or the CPU. It contains factory-programmed identification data that allow the user firmware or other external devices to automatically match its interface to the characteristics of the STM32H742, STM32H743/753 and STM32H750 microcontrollers.

61.1 Unique device ID register (96 bits)

The unique device identifier is ideally suited:

- for use as serial numbers (for example USB string serial numbers or other end applications)
- for use as security keys in order to increase the security of code in Flash memory while using and combining this unique ID with software cryptographic primitives and protocols before programming the internal Flash memory
- to activate secure boot processes, etc.

The 96-bit unique device identifier provides a reference number which is unique for any device and in any context. These bits can never be altered by the user.

The 96-bit unique device identifier can also be read in single bytes/half-words/words in different ways and then be concatenated using a custom algorithm.

Base address: 0x1FF1 E800

Address offset: 0x00

Read only = 0xXXXX XXXX where X is factory-programmed

Bits 31:0 **UID[31:0]**: X and Y coordinates on the wafer

Address offset: 0x04

Read only = 0xXXXX XXXX where X is factory-programmed

Bits 31:8 **UID[63:40]:** LOT_NUM[23:0]

Lot number (ASCII encoded)

Bits 7:0 **UID[39:32]:** WAF_NUM[7:0]

Wafer number (8-bit unsigned number)

Address offset: 0x08

Read only = 0xXXXX XXXX where X is factory-programmed

Bits 31:0 **UID[95:64]:** LOT_NUM[55:24]

Lot number (ASCII encoded)

61.2 Flash size

Base address: 0x1FF1 E880

Address offset: 0x00

Read only = 0xXXXX where X is factory-programmed

Bits 15:0 F_ID(15:0): Flash memory size

This bitfield indicates the size of the device Flash memory expressed in Kbytes.

As an example, 0x0400 corresponds to 1024 Kbytes.

61.3 Package data register

Refer to SYSCFG package register (SYSCFG_PKGR) for package identification. The SYSCFG clock should be enabled first in the RCC_APB4ENR register.

62 Important security notice

The STMicroelectronics group of companies (ST) places a high value on product security, which is why the ST product(s) identified in this documentation may be certified by various security certification bodies and/or may implement our own security measures as set forth herein. However, no level of security certification and/or built-in security measures can guarantee that ST products are resistant to all forms of attacks. As such, it is the responsibility of each of ST's customers to determine if the level of security provided in an ST product meets the customer needs both in relation to the ST product alone, as well as when combined with other components and/or software for the customer end product or application. In particular, take note that:

- ST products may have been certified by one or more security certification bodies, such as Platform Security Architecture (www.psacertified.org) and/or Security Evaluation standard for IoT Platforms (www.trustcb.com). For details concerning whether the ST product(s) referenced herein have received security certification along with the level and current status of such certification, either visit the relevant certification standards website or go to the relevant product page on www.st.com for the most up to date information. As the status and/or level of security certification for an ST product can change from time to time, customers should re-check security certification status/level as needed. If an ST product is not shown to be certified under a particular security standard, customers should not assume it is certified.
- Certification bodies have the right to evaluate, grant and revoke security certification in relation to ST products. These certification bodies are therefore independently responsible for granting or revoking security certification for an ST product, and ST does not take any responsibility for mistakes, evaluations, assessments, testing, or other activity carried out by the certification body with respect to any ST product.
- Industry-based cryptographic algorithms (such as AES, DES, or MD5) and other open standard technologies which may be used in conjunction with an ST product are based on standards which were not developed by ST. ST does not take responsibility for any flaws in such cryptographic algorithms or open technologies or for any methods which have been or may be developed to bypass, decrypt or crack such algorithms or technologies.
- While robust security testing may be done, no level of certification can absolutely guarantee protections against all attacks, including, for example, against advanced attacks which have not been tested for, against new or unidentified forms of attack, or against any form of attack when using an ST product outside of its specification or intended use, or in conjunction with other components or software which are used by customer to create their end product or application. ST is not responsible for resistance against such attacks. As such, regardless of the incorporated security features and/or any information or support that may be provided by ST, each customer is solely responsible for determining if the level of attacks tested for meets their needs, both in relation to the ST product alone and when incorporated into a customer end product or application.
- All security features of ST products (inclusive of any hardware, software, documentation, and the like), including but not limited to any enhanced security features added by ST, are provided on an "AS IS" BASIS. AS SUCH, TO THE EXTENT PERMITTED BY APPLICABLE LAW, ST DISCLAIMS ALL WARRANTIES, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE, unless the applicable written and signed contract terms specifically provide otherwise.

63 Revision history

Table 628. Document revision history

| Date | Revision | Changes |
|-------------|----------|---|
| 12-Dec-2016 | 1 | Initial release. |
| 26-May-2017 | 2 | <p>Section 2 renamed Memory and bus architecture. Updated <i>Section : Embedded bootloader.</i></p> <p>Section 3: Embedded Flash memory (FLASH) Updated <i>Section : Flash sector erase, Section : Standard Flash bank erase, Section : Flash bank erase with automatic protection removal</i> and <i>Section : Flash mass erase.</i> Added <i>Section : Flash mass erase with automatic protection removal.</i> Updated <i>Table 16: FLASH register map and reset value:</i> – FLASH_BOOT7_CURR/PRG (add offset = 0x140/0x144) available only on RM0399. – Added FLASH_CRCEADD2R at add. offset = 0x158 – Added FLASH_CRCEADD2R at add offset = 0x15C</p> <p>Section 6: Power control (PWR) Updated <i>Section 6.3.1: PWR pins and internal signals.</i> Updated VBAT in <i>Section 6.4: Power supplies.</i> Updated <i>Figure 13: Power supply overview</i> and <i>Figure 15: Device startup with VCORE supplied from voltage regulator.</i> Removed VCORE in <i>Section 6.5: Power supply supervision.</i> Updated <i>Figure 24: VCORE voltage scaling versus system power modes</i> and <i>Figure 25: Power control modes detailed state diagram.</i></p> <p>Section 8: Reset and Clock Control (RCC) Names of all clock source selection bits changed from XXSCR to XXSEL. RC48 renamed HSI48. VSWRST bit renamed BDRST in RCC_BDCR and bit description modified. CAMITFEN renamed DCMIEN in RCC_AHB2ENR; and CAMITFLPEN renamed DCMILPEN in RCC_AHB2LPENR. FLITFLPEN bit renamed FLASHLPEN in RCC_AHB3LPENR. HDMICECLPEN renamed CECLPEN in RCC_APB1LLPENR. Updated peripheral kernel clock names in the whole document. Updated <i>Figure 34: System reset circuit</i> to remove VDDA. Updated maximum frequency for ADC1, 2, 3 in <i>Table 51: Kernel clock distribution overview.</i> Removed <i>Isi_ck</i> as USBxOTG clock in <i>Section : Peripherals dedicated to control and data transfer.</i></p> |

| Date | Revision | Changes |
|-------------|---------------|---|
| 26-May-2017 | 2 (continued) | <p>Section 8: Reset and Clock Control (RCC) (continued) Renamed USART7RST/EN/LPEN bits into UART7RST/EN/LPEN, and USART8RST/EN/LPEN bits into UART8RST/EN/LPEN in Section 8.7.31: RCC APB1 Peripheral Reset Register <i>(RCC_APB1LRSTR)</i>, Section 8.7.43: <i>RCC APB1 Clock Register (RCC_APB1LENR)</i> and Section 8.7.52: <i>RCC APB1 Low Sleep Clock Register (RCC_APB1LLPENR)</i>.</p> <p>Section 10: Hardware semaphore (HSEM) Renamed pclk into hsem_hclk in the whole document. Updated COREID bit description in Section 10.4.1: <i>HSEM register (HSEM_R0 - HSEM_R31)</i>.</p> <p>Section 11: General-purpose I/Os (GPIO) <i>Table 84: GPIO register map and reset values:</i> – updated GPIOx_MODER reset values – changed index to A to K for GPIOx_AFRH. – added GPIOC..K_PUPDR</p> <p>Section 12: System configuration controller (SYSCFG) Updated SYSCFG_UR3 register.</p> <p>Section 13: Block interconnect In <i>Table 92: DMAMUX1, DMA1 and DMA2 connections</i>, renamed dac1_dma and dac2_dma into dac_ch1_dma and dac_ch2_dma, respectively. Updated several source and destination signals in <i>Table 88: Peripherals interconnect matrix details</i> and <i>Table 89: EXTI wakeup inputs</i>.</p> <p>Section 17: DMA request multiplexer (DMAMUX) Updated resources in <i>Table 110: DMAMUX1: assignment of multiplexer inputs to resources</i> to <i>Table 112: DMAMUX1: assignment of synchronization inputs to resources</i>.</p> <p>Section 19: Nested Vectored Interrupt Controllers Added LCD-TFT interrupts (Itdc_it and Itdc_err_it) in <i>Table 130: NVIC</i>. Extended interrupt and event controller (EXTI) Replaced DMA1 by BDMA for events 66 to 73 in <i>Table 133: EXTI Event input mapping</i>.</p> |

Table 628. Document revision history (continued)

| Date | Revision | Changes |
|-------------|---------------|--|
| 26-May-2017 | 2 (continued) | <p>Section 22: Flexible memory controller (FMC) – Updated internal signals in <i>Figure 86: FMC block diagram</i> – HCLK renamed fmc_hclk – KCK_FMC renamed fmc_ker_ck Updated <i>Section 22.5: AXI interface</i> to add 32-bit accesses. Read FIFO depth changed to 6x64 bits. AXI bus width correct (64 bits instead of 32 bits). All waveforms made generic for what regards data bus and NBL bits. In <i>Section : SRAM/NOR-Flash chip-select timing registers 1..4 (FMC_BTR1..4)</i>, modified DATAST example and updated BURSTURN description. In <i>Section : SRAM/NOR-Flash write timing registers 1..4 (FMC_BWTR1..4)</i>: updated BURSTURN description. Updated <i>Section : SDRAM Control registers 1,2 (FMC_SDCR1,2)</i> to add bitfield width. Added missing FMC_SDCR2 bits in <i>Table 181: FMC register map</i>.</p> <p>Section 23: Quad-SPI interface (QUADSPI) Updated internal signals in <i>Figure 115: QUADSPI block diagram when dual-flash mode is disabled</i> and <i>Figure 116: QUADSPI block diagram when dual-flash mode is enabled</i>. Added <i>Section 23.3.2: QUADSPI pins and internal signals</i>. Modified error type for access by Cortex CPU in <i>Section 23.3.7: QUADSPI memory-mapped mode</i>. Added <i>Section 23.3.8: QUADSPI Free running clock mode</i> as well as FRCM bit in <i>Section 23.5.6: QUADSPI communication configuration register (QUADSPI_CCR)</i>. Updated <i>Section 23.5.1: QUADSPI control register (QUADSPI_CR)</i>. In <i>Table 185: QUADSPI register map and reset values</i>, changed DMAEN bit to reserved for QUADSPI_CR register.</p> <p>Section 24: Delay block (DLYB) Added internal signals in <i>Figure 123: DLYB block diagram</i> and added <i>Section 24.3.2: DLYB pins and internal signals</i>.</p> <p>Section 25: Analog-to-digital converters (ADC) Number of ADCs changed to 3 in <i>Section 25.1: Introduction</i>. Added internal signals in <i>Section 25.3.1: ADC block diagram</i>. Changed ADCx_IN[19:0] into ADCx_INP[19:0] and ADCx_INN[19:0] in <i>Figure 124: ADC block diagram</i> and <i>Table 190: ADC input/output pins</i>. Changed ADC_CLK into adc_ker_ck. Updated <i>Figure 126: ADC1 connectivity</i>, <i>Figure 127: ADC2 connectivity</i> and <i>Figure 128: ADC3 connectivity</i> and added note below figure. Updated <i>Figure 175: Dual ADC block diagram(1)</i>. Updated notes in <i>Section : Dual clock domain architecture</i>. Updated <i>Section 25.3.11: Channel selection (SQRx, JSQRx)</i> and <i>Section 25.3.12: Channel preselection register (ADCx_PCSEL)</i>.</p> |

Table 628. Document revision history (continued)

| Date | Revision | Changes |
|-------------|---------------|--|
| 26-May-2017 | 2 (continued) | <p>Section 25: Analog-to-digital converters (ADC) (continued) Examples given for 24 MHz instead of 72 MHz in <i>Section 25.3.13: Channel-wise programmable sampling time (SMPR1, SMPR2)</i> and <i>Section 25.3.17: Timing</i>. 6-bit resolution removed and updated <i>Table 195: TSAR timings depending on resolution</i> in <i>Section 25.3.23: Programmable resolution (RES) - fast conversion mode</i>. Updated notes in <i>Section : Combined regular/injected simultaneous mode</i> and <i>Section : Combined regular simultaneous + alternate trigger mode</i>. Added <i>Section : DFSDM mode in dual ADC simultaneous mode</i>. Changed ADC3_IN18 into ADC3 VINP[18] in <i>Section 25.3.33: Temperature sensor</i>. Changed ADC3_IN17 into ADC3 VINP[17] in <i>Section 25.3.34: VBAT supply monitoring</i>. Changed ADC3_IN19 into ADC3 VINP[19] in <i>Section 25.3.35: Monitoring the internal voltage reference</i>. Changed all bit access type to 'r' in <i>Section 25.5.15: ADC x regular Data Register (ADCx_DR) (x=1 to 3)</i>. Updated <i>Table 206: ADC register map and reset values (master and slave ADC common registers) offset =0x300</i>.</p> <p>Section 26: Digital-to-analog converter (DAC) Updated/added internal signals in <i>Figure 194: DAC channel block diagram</i>. Added <i>Section 26.3.2: DAC pins and internal signals</i>. APB1 clock and LSI clock replaced by dac_pclk and by lsi_ck in the whole document.</p> <p>Section 28: Comparator (COMP) Replaced COMP_IFCR by COMP_ICFR in <i>Section 28.7.1: Comparator status register (COMP_SR)</i>.</p> <p>Section 29: Operational amplifiers (OPAMP) Replaced all occurrences of DACx_int by dac_outx (x = 1, 2). Updated VP_SEL bit description in <i>Section 29.6.1: OPAMP1 control/status register (OPAMP1_CSR)</i> register.</p> <p>Section 31: Digital camera interface (DCMI) Section <i>DCMI pins</i> merged with <i>Section 31.4.4: DCMI physical interface</i>. External signals HSYNC, VSYNC and PIXCLK standardized to DCMI_HSYNC, DCMI_VSYNC and DCIM_PIXCLK in the whole document. Updated <i>Figure 224: DCMI block diagram</i> and <i>Figure 225: Top level block diagram</i>.</p> <p>Section 32: LCD-TFT Display Controller (LTDC) LCD-TFT pins and signal interface renamed <i>LCD-TFT pins and external signal interface</i>. Internal signal names updated in <i>Figure 233: LTDC block diagram</i>. ck_axi_d1 renamed ltdc_ack in the whole document. Updated <i>Section 32.3.4: LTDC reset and clocks</i>. Updated CFBP bitfield size in <i>Section 32.7.23: LTDC Layerx Color Frame Buffer Length Register (LTDC_LxCFBLR) (where x=1..2)</i>.</p> |

Table 628. Document revision history (continued)

| Date | Revision | Changes |
|-------------|---------------|---|
| 26-May-2017 | 2 (continued) | <p>Section 33: JPEG codec (JPEG) Added Internal signal names in <i>Figure 238: JPEG codec block diagram</i> and added <i>Section 33.3.2: JPEG internal signals</i>. Suppressed DMA feature. Updated JPEG_CR, JPEG_SR and JPRG_CFR registers in <i>Table 259: JPEG codec register map and reset values</i>.</p> <p>Section 37: High-Resolution Timer (HRTIM) Renamed SCOUT into HRTIM_SCOUT in the whole section. Renamed Tx into HRTIM_CHxy in all figures where it is referred to. Updated internal signals in <i>Figure 274: High-resolution timer block diagram</i>. Added hrtim_in_sync1 and hrtim_out_sync1 in <i>Table 283: HRTIM Input/output summary</i>. Updated <i>Section : Definition of terms</i>. Updated internal signal names in all the figures where they are mentioned and in HRTIM functional description Added note related to hrtim_ker_ck in <i>Table 283: HRTIM Input/output summary</i>. Modified ADC3TAPER bit description in <i>Section 37.5.56: HRTIM ADC Trigger 3 Register (HRTIM_ADC3R)</i>. Modified ADC4TCRST, ADC4TAPER, ADC4TAC2, ADC4EEV6, ADC4MPER and DC4MC1 bit descriptions in and <i>Section 37.5.57: HRTIM ADC Trigger 4 Register (HRTIM_ADC4R)</i>.</p> <p>Section 43: Low-power timer (LPTIM) Added internal signals in <i>Figure 515: Low-power timer block diagram (LPTIM1 and LPTIM2)</i>, <i>Figure 516: Low-power timer block diagram (LPTIM3)</i> and <i>Figure 517: Low-power timer block diagram (LPTIM4 and LPTIM5)</i>. Added <i>Section 43.4.2: LPTIM pins and internal signals</i>. <i>Table 335: LPTIM1 external trigger connection</i> to <i>Table 339: LPTIM5 external trigger connection</i> updated and moved under <i>Section 43.4.3: LPTIM input and trigger mapping</i>. <i>Table 340: LPTIM1 Input 1 connection</i> to <i>Table 344: LPTIM3 Input 1 connection</i> updated and moved under <i>Section 43.4.3: LPTIM input and trigger mapping</i>. Updated TRIGSEL bitfield description in <i>Section 43.6.4: LPTIM configuration register (LPTIM_CFGR)</i>.</p> <p>Section 43: Low-power timer (LPTIM) (continued) Added caution note for COUNTRST bit in <i>Section 43.6.5: LPTIM control register (LPTIM_CR)</i>. Updated IN1SEL and IN2SEL bitfield description and added caution note in <i>Section 43.6.9: LPTIM configuration register 2 (LPTIM_CFGR2)</i>. Added caution note in <i>Section 43.6.10: LPTIM3 configuration register 2 (LPTIM3_CFGR2)</i>.</p> |

Table 628. Document revision history (continued)

| Date | Revision | Changes |
|-------------|---------------|--|
| 26-May-2017 | 2 (continued) | <p>Section 46: Real-time clock (RTC) Added <i>Figure 527: RTC block overview</i>. Updated title of <i>Figure 528: Detailed RTC block diagram</i>. Added <i>Section 46.3.2: RTC pins and internal signals</i>. Updated <i>Table 353: RTC pins and internal signals</i>. Updated <i>Section 46.3.3: GPIOs controlled by the RTC</i>. Updated <i>Section 46.6.16: RTC tamper configuration register (RTC_TAMPCR)</i>.</p> <p>Section 47: Inter-integrated circuit (I2C) interface Updated OA1[7:1] and OA2[7:1] bit description in <i>Section 47.7.3: Own address 1 register (I2C_OAR1)</i> and <i>Section 47.7.4: Own address 2 register (I2C_OAR2)</i>. Replaced HSI16 by HSI or CSI or internal oscillator in <i>Section 47.4.14: Wakeup from Stop mode on address match</i>.</p> <p>Section 48: Universal synchronous asynchronous receiver transmitter (USART) <i>Section 48.5.14: USART synchronous mode</i>: removed <i>Figure RX data setup/hold time</i>, added reference to synchronous master mode in <i>Figure 574: USART data clock timing diagram in synchronous master mode (M bits = '00')</i> and <i>Figure 575: USART data clock timing diagram in synchronous master mode (M bits = '01')</i> and figure contents updated to mention two M bits instead of one. Updated <i>Figure 586: Wakeup event verified (wakeup event = address match, FIFO disabled)</i> in <i>Section 48.5.21: USART low-power management</i>.</p> <p>Section 51: Serial audio interface (SAI) Updated SYNCIN bitfield description in <i>Section 51.5.1: Global configuration register (SAI_GCR)</i>.</p> <p>Section 50: Serial peripheral interface (SPI) Updated note in <i>Section : Simplex communications</i>. Added note about the PCM long and short frame definition in <i>Section : PCM standard</i>. Added <i>Section 50.9.3: Bits and fields usable in I2S/PCM mode</i> description and <i>Table 391: Bit fields usable in PCM/I2S mode</i>. Updated WSINV in <i>Section 50.11.14: SPI/I2S configuration register (SPI_I2SCGFR)</i> and <i>Section 50.12: SPI register map and reset values</i>.</p> <p>Section 52: SPDIF receiver interface (SPDIFRX) Added internal signals in <i>Section Figure 658.: SPDIFRX block diagram</i> and added <i>Section 52.3.1: SPDIFRX pins and internal signals</i>.</p> |

Table 628. Document revision history (continued)

| Date | Revision | Changes |
|-------------|---------------|--|
| 26-May-2017 | 2 (continued) | <p>Section 55: Secure digital input/output MultiMediaCard interface (SDMMC) – Renamed internal signals in the whole section; updated <i>Figure 694: SDMMC block diagram</i>; added <i>Section 55.4.2:SDMMC pins and internal signals</i> – Added <i>Section 55.4.7: MDMA request generation</i> – Removed SDMMC_VER, SDMMC_ID, SDMMC_SID – Updated SDMMC_STAR bit 12 and 13 in <i>Table 449: SDMMC register map</i>.</p> <p>Section 56: FD Controller Area Network (FDCAN) ASC (asynchronous serial communication) removed from the whole section. Added F00M bit (bit 31) and F10M bit (bit 31) in <i>FDCAN Rx FIFO 0 Configuration Register (FDCAN_RXF0C)</i> and <i>FDCAN Rx FIFO 1 Configuration Register (FDCAN_RXF1C)</i>, respectively.</p> <p>Section 57: USB on-the-go high-speed (OTG_HS) Added <i>Section 57.4.2: USB OTG pin and internal signals</i>.</p> <p>Section 60: Debug infrastructure Updated <i>Section 60.5.8: Microcontroller debug unit (DBGMCU)</i>. Replaced in all DBGMCU register names: – D1APB1 by APB3 – D2APB1 by APB1 – D2APB2 by APB2 – D3APB4byAPB4 WDGLSD2 bit changed to reserved in <i>Section : DBGMCU APB4 peripheral freeze register CPU (DBGMCU_APB4FZ1)DBGMCU_APB4FZ1</i>. Removed reserved registers in <i>Table 578: DBGMCU register map and reset values</i>.</p> <p>Section 2.3: Embedded SRAM Added <i>Section : Error code correction (ECC)</i>. Section 12: System configuration controller (SYSCFG) Changed 2.5 to 2.7 V in HSLV bit description of <i>SYSCFG compensation cell control/status register (SYSCFG_CCCSR)</i> and <i>IO_HSLV of SYSCFG user register 17 (SYSCFG_UR17)</i>.</p> <p>Section 3: Embedded Flash memory (FLASH) In <i>Table 16: FLASH register map and reset value</i>: – Updated FLASH_OPTSR_CUR at address offset 0x11C. – Updated FLASH_OPTSR_PRG at address offset 0x120. Changed 2.5 to 2.7 V in <i>IO_HSLV bit description of FLASH option status register (current value) (FLASH_OPTSR_CUR)</i> and <i>FLASH option status register (value to program) (FLASH_OPTSR_PRG)</i>.</p> |

Table 628. Document revision history (continued)

| Date | Revision | Changes |
|-------------|----------|---|
| 11-Aug-2017 | 3 | <p>Section 6: Power control (PWR) Replace AIEC by EXTI and wait VDD11 by Wait VCORE in Figure 27: Dynamic voltage scaling behavior with D1, D2 and <i>system in Stop mode</i>, Figure 28: <i>Dynamic Voltage Scaling D1, D2, system Standby mode</i> and Figure 29: <i>Dynamic voltage scaling</i> behavior with D1 and D2 in DStandby mode and D3 in <i>autonomous mode</i>. Updated Section 6.4.7: <i>USB regulator</i>. Updated Section : <i>Entering Stop mode</i>.</p> <p>Section 7: Low-power D3 domain Replaced VDD11 by VCORE.</p> <p>Section 8: Reset and Clock Control (RCC) Updated maximum frequency for ADC1, 2, 3 in Table 51: <i>Kernel clock distribution overview</i>.</p> <p>Section 10: Hardware semaphore (HSEM) Whole section updated to align with the product features.</p> <p>Section 14: MDMA controller (MDMA) Removed iterator in MDMA_CxISR and MDMA_CxIFCR bit names.</p> <p>Section 19: Nested Vectored Interrupt Controllers Changed usart4_gbl_it into uart4_gbl_it in Table 130: <i>NVIC</i>.</p> <p>Section 21: Cyclic redundancy check calculation unit (CRC) Updated first two features of Section 21.2: <i>CRC main features</i>.</p> <p>Section 25: Analog-to-digital converters (ADC) Section 25.2: <i>ADC main features</i>: suppressed ADC supply requirements. Renamed VTS into VSENSE in the whole section. Updated Figure 124: <i>ADC block diagram</i>, Figure 126: <i>ADC1 connectivity</i>, Figure 127: <i>ADC2 connectivity</i> and Figure 128: <i>ADC3 connectivity</i>. VINN connected to ADC_INN instead of ADC_INN-1 in Table 190: <i>ADC input/output pins</i>. Section : <i>I/O analog switches voltage booster</i>: voltage booster enable bit renamed BOOTSE (instead of BOOTSEN) and corresponding register renamed SYSCFG_PMCR (instead of SYSCFG_CFGR1).</p> |

Table 628. Document revision history (continued)

| Date | Revision | Changes |
|-------------|---------------|--|
| 11-Aug-2017 | 3 (continued) | <p>Section 25: Analog-to-digital converters (ADC) (continued) Added note related to software trigger selection in <i>Section 25.3.16: Starting conversions (ADSTART, JADSTART)</i>. Updated <i>Figure 136: Triggers are shared between ADC master and ADC slave</i>, <i>Figure 191: Temperature sensor channel block diagram</i>, <i>Figure 192: VBAT channel block diagram</i> and <i>Figure 193: VREFINT channel block diagram</i>. Updated <i>Section : Analog watchdog</i>. Updated software notification by interrupt at end of conversion in <i>Section : Interleaved mode with independent injected</i>; updated <i>Figure 178: Interleaved mode on 1 channel in continuous conversion mode: dual ADC mode</i> and <i>Figure 179: Interleaved mode on 1 channel in single conversion mode: dual ADC mode</i>. Removed temperature sensor precision and replaced ambient by junction temperature in <i>Section 25.3.33: Temperature sensor</i>. Section 25.6.2: ADC x common control register (ADCx_CCR) (x=12 or 3): – VBATEN bit description made generic – TSEN renamed VSENSEEN and description made generic – Updated <i>Table 203: DELAY bits versus ADC resolution</i>. ADCx_OR register suppressed since all bits are reserved. Renamed ADCx_LHTR1 into ADCx_HTR1. Changed ADCx_ISR bit access type to rc_w1. Updated iterators for all ADC common registers</p> <p>Section 26: Digital-to-analog converter (DAC) Updated VREF+ range in <i>Table 207: DAC input/output pins</i>. Updated <i>Section 26.3.5: DAC conversion</i>. Added note related to ENx limitation when CENx is set in <i>Section 26.3.12: DAC channel buffer calibration</i>. Added case of accesses to DHRxxD for wave generation in <i>Section 26.3.13: Dual DAC channel conversion (if available)</i>. Renamed DAC_M_ID into DAC_SIDR and M_ID bits into SID.</p> <p>Section 26: Digital-to-analog converter (DAC) (continued) Added <i>Section 26.5: DAC interrupts</i> Section 26.6.1: DAC x control register (DACx_CR) (x=1 to 2): – TEN2 bit: replaced DACx_DHRy by DACx_DHR2 – TEN1 bit: replaced DACx_DHRy by DACx_DHR1. – TSELx bits: updated information on trigger selection/mapping Section 26.6.16: DAC x mode control register (DACx_MCR) (x=1 to 2): added note related to ENx bit for MODEx bit description. Section 26.6.19: DAC x Sample and Hold hold time register (DACx_SHHR)(x=1 to 2): added notes related to THOLDx modification when ENx=0. Section 26.6.20: DAC x Sample and Hold refresh time register (DACx_SHRR)(x=1 to 2): added note related to TREFRESHx modification when ENx=0. Suppressed DAC_OR register.</p> |

Table 628. Document revision history (continued)

| Date | Revision | Changes |
|-------------|---------------|---|
| 11-Aug-2017 | 3 (continued) | <p>Section 29: Operational amplifiers (OPAMP) Updated OPAMP1_VINM internal connection in <i>Table 225: Operational amplifier possible connections</i>.</p> <p>Section 37: High-Resolution Timer (HRTIM) Updated Note 1. in <i>Table 289: External events mapping and associated features</i>.</p> <p>Section 44: System window watchdog (WWDG) Corrected math equations used to calculate the WWDG period.</p> <p>Section 47: Inter-integrated circuit (I2C) interface Updated NACKCF bit definition in <i>Section 47.7.8: Interrupt clear register (I2C_ICR)</i> register.</p> <p>Section 51: Serial audio interface (SAI) SAIXEN bit renamed SAIEN in SAI_xCR register. Updated <i>Figure 643: PDM typical connection and timing</i> to make the block diagram independent from the number of data and clock lines. Updated <i>Figure 644: Detailed PDM interface block diagram</i> to add “n” and “p” indexes (n being the number of data lines and p the number of microphone pairs).</p> <p>Section 52: SPDIF receiver interface (SPDIFRX) Updated <i>Figure 658: SPDIFRX block diagram</i>.</p> <p>Section 59: HDMI-CEC controller (HDMI-CEC) Updated – <i>Section 59.2: HDMI-CEC controller main features</i> – Updated <i>Figure 798: HDMI-CEC block diagram</i></p> <p>Section 61: Device electronic signature Updated Unique device ID register base address in <i>Section 61.1: Unique device ID register (96 bits)</i>. Updated Flash size base address in <i>Section 61.2: Flash size</i>. Replaced package data register description by reference to SYSCFG_PKGR in <i>Section 61.3: Package data register</i>.</p> |

Table 628. Document revision history (continued)

| Date | Revision | Changes |
|-------------|----------|--|
| 28-Jun-2018 | 4 | <p>Section 2: Memory and bus architecture Updated Figure 1: System architecture for STM32H743/53xx and STM32H750xB devices. Updated Table 2: Bus-master-to-bus-slave interconnect. Section 2.1.6: CPU buses: updated Cortex®-M7 and Cortex®-M7 DTCM, core with FPU replaced by CPU for I-bus, D_bus and S-bus. Section 2.1.7: Bus master peripherals: updated MDMA controller, DMA1/2 controllers and BDMA controller. Added Table 6: Memory map and default device memory area attributes in Section 2.3.2: Memory map and register boundary addresses. Updated Table 7: Register boundary addresses.</p> <p>Major update of Section 4: Embedded Flash memory (FLASH).</p> <p>Section 4: Secure memory management: Modified title.</p> <p>Section 5: Power control (PWR) Changed RC48 to HSI48 in Figure 18: Power supply overview.</p> <p>Section 7: Reset and Clock Control (RCC) Removed USB_PHY2 in the whole section. Updated maximum allowed clock frequency for ADC1, 2, 3 Table 58: Kernel clock distribution overview. Updated Figure 52: Kernel clock distribution for USB (2).</p> <p>In RCC_AHB1ENR/RCC_C1_AHB1ENR: renamed USB2OTGEN into USB2OTGHSEN, USB1ULPIEN into USB1OTGHSULPIEN, USB1OTGEN into USB1OTGHSEN. In RCC_AHB1LPENR/RCC_C1_AHB1LPENR: renamed USB2OTGLPEN into USB2OTGHSLPEN, USB1ULPILPEN into USB1OTGHSULPILPEN, USB1OTGLPEN into USB1OTGHSLPEN. Bits changed to reserved: TMPSENSRST of RCC_APB4RSTR register, TMPSENSEN of RCC_APB4ENR and TMPSENSLPEN of RCC_APB4LPENR.</p> <p>Section 13: System configuration controller (SYSCFG) Renamed SYSCFG_CMPCR into SYSCFG_CCCSR. Added SYSCFG configuration register (SYSCFG_CFGR). SYSCFG user register 2 (SYSCFG_UR2): changed High/medium/Low level to Level3/2/1. SYSCFG user register 11 (SYSCFG_UR11): swapped IWDG1M configurations. SYSCFG user register 12 (SYSCFG_UR12): swapped IWDG2M configurations.</p> |

Table 628. Document revision history (continued)

| Date | Revision | Changes |
|-------------|---------------|---|
| 28-Jun-2018 | 4 (continued) | <p>Section 12: Block interconnect</p> <p>In Table 92: Peripherals interconnect matrix details: Changed EXTx into adc_ext_trgx and JEXTx into adc_jext_trgx for ADC3 Updated D2/USB1/2 SOF connection Changed PRC0 to 3 into d3_pendclear_in[0] to d3_pendclear_in[3] in Table 94: EXTI pending requests clear inputs. Added DSI signals in Table 95: MDMA. Updated EXTI connection in Table 97: DMAMUX2 and BDMA connections: dmamux1_req_inx numbering changed to start from dmamux1_req_in1 instead of dmamux1_req_in0 in Table 96: DMAMUX1, DMA1 and DMA2 connections and Table 97: DMAMUX2 and BDMA connections</p> <p>Section 16: Basic direct memory access controller (BDMA)</p> <p>Major section update.</p> <p>Section 12: DMA request multiplexer (DMAMUX)</p> <p>Updated Section 12.2: DMAMUX main features. Updated all tables from Table 115: DMAMUX1 and DMAMUX2 instantiation to Table 121: DMAMUX2: assignment of synchronization inputs to resources. Updated Section : Synchronization mode and channel event generation. Removed note from Section : Synchronization overrun and interrupt. Updated Section 12.4.5: DMAMUX request generator, Section 16.6.1: DMAMUX1 request line multiplexer channel x configuration register (DMAMUX1_CxCR), Section 16.6.2: DMAMUX2 request line multiplexer channel x configuration register (DMAMUX2_CxCR), Section 16.6.7: DMAMUX1 request generator channel x configuration register (DMAMUX1_RGxCR) and Section 16.6.8: DMAMUX2 request generator channel x configuration register (DMAMUX2_RGxCR). Removed Section 12.6.13: DMAMUX illegal access flag register (DMAMUX_IAFR), Section 12.6.14: DMAMUX illegal access flag clear status register (DMAMUX_IAFCR) and Section 12.6.15: DMAMUX illegal access interrupt enable register (DMAMUX_IAIER).</p> |

Table 628. Document revision history (continued)

| Date | Revision | Changes |
|-------------|---------------|---|
| 28-Jun-2018 | 4 (continued) | <p>Section 18: Chrom-Art Accelerator™ controller (DMA2D) Added Section 18.4.8: DMA2D output FIFO byte reordering. Added Section : Memory-to-memory with PFC, blending and fixed color FG and Section : Memory-to-memory with PFC, blending and fixed color BG. Updated Section 18.6.1: DMA2D control register (DMA2D_CR): Updated MODE[2:0] to MODE[3:0] bit description. Added bit 6 LOM Updated Section 18.6.5: DMA2D foreground offset register (DMA2D_FGOR) LO[15:0] bit description. Updated Section 18.6.7: DMA2D background offset register (DMA2D_BGOR) LO[15:0] bit description. Updated Section 18.6.9: DMA2D foreground color register (DMA2D_FGCOLR). Updated Section 18.6.11: DMA2D background color register (DMA2D_BGCOLOR). Updated Section 18.6.14: DMA2D output PFC control register (DMA2D_OPFCCR) adding SB bit 6 description. Updated Section 18.6.17: DMA2D output offset register (DMA2D_OOR) LO[15:0] bit description. Added identification registers: DMA2D_VERR, DMA2D_IPIDR, DMA2D_SIDR.</p> <p>Section 20: Nested Vectored Interrupt Controllers (NVIC1 and NVIC2) Updated Table 138: NVIC and Section 20.1.1: SysTick calibration value register.</p> <p>Section 21: Extended interrupt and event controller (EXTI) Added note related to WKUP1 to 6 in Table 155: EXTI Event input mapping</p> <p>Section 23: Flexible memory controller (FMC) Updated Figure 106: FMC memory banks (default mapping) and Table 147: FMC bank mapping options to change Bank 4 to “not used by FMC). Updated Section : General transaction rules.</p> <p>Section 15: Quad-SPI interface (QUADSPI) Updated access types in Section 15.5.1: QUADSPI control register (QUADSPI_CR) and Section 15.5.4: QUADSPI flag clear register (QUADSPI_FCR).</p> <p>Section 28: Analog-to-digital converters (ADC) f_{ADC} and TADC replaced by $f_{ADC_ker_ck}$ and $t_{ADC_ker_ck}$ in the whole IP user specification. Added $f_{ADC_ker_ck}$ in Figure 179: ADC clock scheme. FHCLK replaced by f_{ADC_hclk} in Section : Clock ratio constraint between ADC clock and AHB clock. Replaced EXTSEL by JEXTSEL and $adc_ext_trg0/1$ by $adc_jext_trg0/1$ in Table 202: ADC1, ADC2 and ADC3 - External triggers for injected channels. Updated note for JEOIE in Section 28.6.2: ADC interrupt enable register (ADC_IER).</p> |

Table 628. Document revision history (continued)

| Date | Revision | Changes |
|-------------|---------------|--|
| 28-Jun-2018 | 4 (continued) | <p>Section 28: Analog-to-digital converters (ADC) (continued) Updated conditions for programming ADC_JSQR register in Section 28.4.10: Constraints when writing the ADC control bits, Section 28.4.11: Channel selection (SQRx, JSQRx), as well as in notes related to all Section 28.6.16: ADC injected sequence register (ADC_JSQR) bitfields (product errata sheets updated accordingly). Updated note related to offset correction in Section : Single ADC operating modes support when oversampling. Updated Section 28.6.8: ADC channel preselection register (ADC_PCSEL). Removed calibration value in Section 28.6.26: ADC calibration factors register (ADC_CALFACT).</p> <p>Section 30: Digital-to-analog converter (DAC) Changed data register indexing scheme in the whole document. Updated Figure 252: Dual-channel DAC block diagram. Added Section 30.3: DAC implementation. Section : Sample and Hold mode: Replaced SAMx by TSAMPEx. Replaced CL by CSH. Replaced TSAMx by TSAMPLEx. Replaced TREFx by TREFRESHx/ Replaced t_{sampling} by t_{SAMP}. Replaced $t_{\text{stab-BON}}$ and $t_{\text{stab-BOFF}}$ by 7 μs and 3 μs, respectively. Replace $T_{\text{offtrimmax}}$ by t_{TRIM}. DAC status register (DAC_SR): for DAC1RDY and DAC1RDYbits, replaced DAC_CH1 and DAC_CH2 by DAC channel 1 and DAC channel 2, respectively.</p> <p>Section 32: Digital filter for sigma delta modulators (DFSDM) Updated Section 32.4.3: DFSDM reset and clocks and Section 32.4.4: Serial channel transceivers.</p> <p>Section 33: Digital camera interface (DCMI) Added 10-12-14-bit progressive video format in Section 33.5.1: Data formats.</p> <p>Section 21: True random number generator (RNG) BYP removed in the register description and map register.</p> <p>Section 37: Hash processor (HASH) In the whole document: Replaced SHA1, SHA224, SHA256 by SHA-1, SHA-224, SHA-256. Replaced HASH_Hx by HASH_HRx Updated Section 37.1: Introduction Updated Section 37.2: HASH main features Updated Section 37.3.3: About secure hash algorithms</p> |

Table 628. Document revision history (continued)

| Date | Revision | Changes |
|-------------|---------------|---|
| 28-Jun-2018 | 4 (continued) | <p>Section 24: Advanced-control timers (TIM1) Updated procedure in Section : External clock source mode 1, Section 24.3.7: Input capture mode, Section 24.3.8: PWM input mode and Section 24.3.20: One-pulse mode. Updated Section 24.3.16: Using the break function, including Figure 191: Break and Break2 circuitry overview.</p> <p>Section 25: General-purpose timer (TIM2) Added TIM4 timer input selection register (TIM4_TISEL)</p> <p>Section 26: General-purpose timers (TIM16/TIM17) TI1SEL[3:0] description updated for 0001 configuration in Section 26.4.22: TIM17 input selection register (TIM17_TISEL).</p> <p>Section 27: Low-power timer (LPTIM) Added Section 27.4.15: Debug mode.</p> <p>Section 31: System window watchdog (WWDG) Updated Figure 290: Watchdog block diagram and Figure 291: Window watchdog timing diagram. Updated Section 31.3.2: Enabling the watchdog and Section 31.3.6: Debug mode. Updated Table 174: WWDG register map and reset values.</p> <p>Section 32: Inter-integrated circuit (I2C) interface Updated Figure 292: I2C block diagram. Updated Section 32.4.5: I2C initialization removing the reference to RCC and modified Figure 294: Setup and hold timings. Updated Table 189: Effect of low-power modes on the I2C. Updated Section 32.6: I2C interrupts. Updated note in Section : Master communication initialization (address phase). Updated START bit 13 description in Section 32.7.2: I2C control register 2 (I2C_CR2).</p> <p>Section 33: Universal synchronous/asynchronous receiver transmitter (USART/UART) Section title updated to include UART Added DWU formula in Section 33.5.8: Tolerance of the USART receiver to clock deviation. Updated Section 33.5.21: USART low-power management Added Section : Determining the maximum USART baud rate that allows to correctly wake up the microcontroller from low-power mode. Replaced undocumented w_r0 access type by w access type in Section 33.7.8: USART request register (USART_RQR). Updated notes related to reserved bit/bitfield depending on USART feature in USART control register 1 [alternate] (USART_CR1), USART control register 2 (USART_CR2), USART control register 3 (USART_CR3), USART interrupt and status register [alternate] (USART_ISR) and USART interrupt flag clear register (USART_ICR).</p> |

Table 628. Document revision history (continued)

| Date | Revision | Changes |
|-------------|---------------|---|
| 28-Jun-2018 | 4 (continued) | <p>Section 34: Low-power universal asynchronous receiver transmitter (LPUART) Updated Section : Determining the maximum LPUART baud rate that allows to correctly wake up the MCU from low-power mode. Transmit data register (LPUART_TDR) and Receive data register (LPUART_RDR) reset value changed from undefined to 0x0000 0000. Updated notes related to reserved bit/bitfield depending on LPUART feature in Control register 3 (LPUART_CR3) and Interrupt and status register [alternate] (LPUART_ISR).</p> <p>Section 36: Serial audio interface (SAI) Updated Section : Clock generator programming in SPDIF generator mode.</p> <p>Section 54: SPDIF receiver interface (SPDIFRX) Suppressed references to spdifrx_symb_ck in the whole section. Removed SPDIFRX_VERR/IDR/SIDR registers.</p> <p>Section 57: FD controller area network (FDCAN) Changed fdcan_ker_ck max value from 500 MHz to 100 MHz. Major section update.</p> <p>Section 57: USB on-the-go high-speed (OTG) Major section update.</p> <p>Section 61: Ethernet (ETH): Gigabit media access control (GMAC) with DMA controller Updated Rx flow control sequence in Section : Receive flow control. Removed column "Behavior of the sbd_perch_tx_intr_o[] and sbd_perch_rx_intr_o[]" in Table 523: Transfer complete interrupt behavior. Remove all references to non-user internal signals in register descriptions. Updated SARC[2:0] configurations in Operating mode configuration register (ETH_MACCCR). Updated DZPQ bit description in Tx Queue 0 flow control register (ETH_MACQ0TXFCR). Changed bit 21 to reserved in LPI control status register (ETH_MACLCSR). Changed bits 1:2 to reserved in Interrupt enable register (ETH_MACIER). Changed bits 1, 2 and 15 to reserved in Interrupt status register (ETH_MACISR). Changed bit 28 to reserved in L3 and L4 control 1 register (ETH_MACL3L4C1R). Removed ETH_MTLRxQ1OMR register description and updated Rx queue i operating mode register (ETH_MTLRxQiOMR) to support both Queue 0 and 1. Changed bits 20:16 to reserved in MMC Rx interrupt mask register (ETH_MMC_RX_INTERRUPT_MASK).</p> |

Table 628. Document revision history (continued)

| Date | Revision | Changes |
|-------------|---------------|--|
| 28-Jun-2018 | 4 (continued) | <p>Section 63: Debug infrastructure</p> <p>Updated Section 63.5.1: System ROM tables. Renamed CSTF_TYPID register into CSTF_DEVTYPE. Updated CSTF_CTRL and CSTF_PRIORITY priority in Table 607: CSTF register map and reset values. Renamed MAXNUM bit into MUXNUM in TPIU device configuration register (TPIU_DEVID). Renamed SWTF_TYPEID register into SWTF_DEVTYPE. Updated DBGMCU identity code register (DBGMCU_IDC) reset value and added revision X. Updated ITM trace privilege registers (M7_ITM_TPR). Removed M7_ETM_DEVID register. Updated Debug port target identification register (DP_TARGETID). DBGMCU_APB1HFZ1 removed.</p> |
| 25-Jun-2018 | 5 | <p>Added STM32H750xB microcontrollers: Update cover page including Related documents Updated Table 2: Bus-master-to-bus-slave interconnect Updated Figure 1: System architecture for STM32H743/53xx and STM32H750xB devices Updated Section 4.3.4: Flash memory architecture and usage. Specified that parallel operations are not possible on STM32H750xB devices in Section 4.3.11: FLASH parallel operations (STM32H743/753 devices only). Specified that bank swapping is not available on STM32H750xB devices in Section 4.3.15: Flash bank and register swapping (STM32H743/753 devices only) and notes added for bit SWAP_BANK and SWPA_BANK_OPT in FLASH_OPTCR and FLASH_OPTCR_PRG register, respectively. Section 61: Ethernet (ETH): Gigabit media access control (GMAC) with DMA controller: Added Figure 735: Supported PHY interfaces. Updated Remote wakeup packet filter register (ETH_MACRWKPFRR) description to replace wkuppktfilter_reg by ETH_MACRWKPFRR and restrict the number of filters to 4.</p> |

Table 628. Document revision history (continued)

| Date | Revision | Changes |
|-------------|----------|---|
| 04-Apr-2019 | 6 | <p>Added STM32H742xx part numbers. Added Table 1: Peripherals versus products. Added STM32H742xx and STM32H750xx in Table 2: Availability of security features. Added case of reset during half word write in Section : Error code correction (ECC).</p> <p>Section 4: Embedded Flash memory (FLASH) Updated Figure 8: Embedded Flash memory usage. Section : Adjusting programming timing constraints: added note related to WRHIGHFREQ modification during Flash memory programming/erasing. Section : Adjusting programming parallelism: added note related to PSIZE1/2 modification during Flash memory programming/erasing. Secure DTCM size (ST_RAM_SIZE): Removed Secure DTCM size (ST_RAM_SIZE) from Section : Changing security option bytes. Updated ST_RAM_SIZE description and added ST_RAM_SIZE to the values programmed in the data protection option bytes in Section 4.4.6: Description of data protection option bytes. Section : Definitions of RDP global protection level: updated description of RDP level 1 to 0 regression and RDP level 2. Section : RDP protection transitions: user Flash memory can be partially or mass erased when doing a level regression from RDP level 1 to 0.</p> <p>Section 5: Secure internal Flash memory (SIFM) (former Secure memory management section) Removed Section Flash protections. Updated Section 5.3.1: Associated features and Section 5.3.2: Boot state machine. Added and added Note 2. below Figure 15: Flash memory areas and services in Standard and Secure access modes. Updated Figure 16: Bootloader state machine in Secure access mode. Updated Section 5.3.3: Secure access mode configuration. Restructured Section 5.4: Root secure services (RSS): Added Section 5.4.1: Secure area setting service and Section 5.4.2: Secure area exiting service Renamed RSS services (removed RSS_ prefix). Removed RSS_resetAndDestroyPCROArea Updated Section 5.5.1: Access rules and Section 5.5.2: Setting secure user memory areas. Remove sections Removing secure memory areas and Selecting secure user software. Updated Figure 17: Core access to Flash memory areas</p> |

Table 628. Document revision history (continued)

| Date | Revision | Changes |
|-------------|---------------|---|
| 04-Apr-2019 | 6 (continued) | <p>Section 6: Power control (PWR) Added case of device startup with VCORE supplied in Bypass mode in Section 6.4.1: System supply startup. Added VOS0 in Section 6.4.2: Core domain, Section 6.4.3: PWR external supply and Section 6.6.2: Voltage scaling. Added Section : VOS0 activation/deactivation sequence. Updated Section 6.5.5: Battery voltage thresholds. Updated Section 6.5.6: Temperature thresholds to indicate that the thresholds are available only when the backup regulator is enabled. Added note related to VOS0i activation in Section : Entering Stop mode and Section : Entering Standby mode. Added Section 6.7.11: Monitoring low-power modes. Added note related to VBAT and temperature monitoring availability for MONEN bit of Section 6.8.3: PWR control register 2 (PWR_CR2). SCUEN bit is no more read-only in Section 6.8.4: PWR control register 3 (PWR_CR3) register description.</p> <p>Section 8: Reset and Clock Control (RCC) Changed adc_ker_ck to adc_ker_ck_input in the whole section. Updated Section : HSE oscillator, Section : LSE oscillator and Figure 46: HSE/LSE clock source. Changed maximum frequency to 480 MHz in Figure 49: Core and bus clock generation. Updated Table 58: Kernel clock distribution overview. Specified that RCC Internal Clock Source Calibration Register (RCC_ICSCR) is available only on revision Y and added RCC HSI configuration register (RCC_HSICFGR). Specified that RCC Clock Recovery RC Register (RCC_CRRCCR) is available only on revision Y and added RCC CSI configuration register (RCC_CSICFGR). Updated DIVP1[6:0] in RCC PLL1 Dividers Configuration Register (RCC_PLL1DIVR). Renamed BKPSRAMAMEN into BKPRAMAMEN in RCC D3 Autonomous mode Register (RCC_D3AMR). Added USB2OTGHSULPIEN in RCC AHB1 Clock Register (RCC_AHB1ENR), and USB2OTGHSULPILPEN in RCC AHB1 Sleep Clock Register (RCC_AHB1LPENR). Renamed HDMICECRST into CECRST in RCC APB1 Peripheral Reset Register (RCC_APB1LRSTR), and HDMICECEN to CECEN in RCC APB1 Clock Register (RCC_APB1LENR). Changed CPURST bit to in RCC AHB3 Sleep Clock Register (RCC_AHB3LPENR).</p> <p>Section 11: General-purpose I/Os (GPIO) Updated Figure 76: Analog inputs connected to ADC inputs to specify that the analog switch status depends on PxySO reset value in SYSCFG_PMCR. MODER reset state changed to analog mode in Section 11.4.1: GPIO port mode register (GPIOx_MODER) (x =A to K).</p> |

Table 628. Document revision history (continued)

| Date | Revision | Changes |
|-------------|---------------|--|
| 04-Apr-2019 | 6 (continued) | <p>Section 12: System configuration controller (SYSCFG) Added BOOSTVDDSEL bit in SYSCFG peripheral mode configuration register (SYSCFG_PMCR). Added note related to CSI clock required for setting READY bit in SYSCFG configuration register (SYSCFG_CFGR). Added SYSCFG power control register (SYSCFG_PWRCR).</p> <p>Section 16: Basic direct memory access controller (BDMA) Updated Section : Channel state and disabling a channel.</p> <p>Section 17: DMA request multiplexer (DMAMUX) Removed references to security and privileged/unprivileged access control in Section 17.6.4: DMAMUX2 request line multiplexer interrupt channel status register (DMAMUX2_CSR), Section 17.6.6: DMAMUX2 request line multiplexer interrupt clear flag register (DMAMUX2_CFR) and Section 17.6.8: DMAMUX2 request generator channel x configuration register (DMAMUX2_RGxCR).</p> <p>Section 18: Chrom-Art Accelerator™ controller (DMA2D) Replaced DMA2D_FGPFCCR by DMA2D_FGPFCCR in Section : Memory-to-memory with PFC, blending and fixed color FG. Replaced DMA2D_BGPFCCR by DMA2D_BGPFCCR in Section : Memory-to-memory with PFC, blending and fixed color BG. Updated Section 18.6.9: DMA2D foreground color register (DMA2D_FGCOLR). Added Section 18.6.21: DMA2D foreground CLUT (DMA2D_FGCLUT[y]) and Section 18.6.22: DMA2D background CLUT (DMA2D_BGCLUT[y]). Table 141: DMA2D register map and reset values: changed APLHA[7:0] to reserved for DMA2D_FGCOLR and APLHA[7:0] to reserved for DMA2D_BGCOLR.</p> <p>Section 22: Flexible memory controller (FMC) Replaced BCH8 by Hamming in Section 22.8.6: Computation of the error correction code (ECC) in NAND Flash memory. Updated Figure 109: Mode D write access waveforms.</p> <p>Section 24: Delay block (DLYB) Updated Section 24.1: Introduction to specify that the DLYB output clock can be used to clock the data received by Quad-SPI interface.</p> |

Table 628. Document revision history (continued)

| Date | Revision | Changes |
|-------------|---------------|--|
| 04-Apr-2019 | 6 (continued) | <p>Section 25: Analog-to-digital converters (ADC) Renamed adc_ker_ck into adc_ker_ck_input in the hole section. Renamed OVSR into OVR, OSR into OSVR[9:0] and AUTODLY into AUTDLY. Added Section 25.3: ADC implementation. For all ADC internal channels connected to VBAT, VSENSE, VREFINT, and DAC internal channels, changed ADC channel name from ADCx_INPy/INMy to ADCx VINP[y]/VINM[y]. Updated Figure 136: ADC clock scheme to distinguish between revision Y (without Fadc_ker_ck_input divider and revision V without Fadc_ker_ck_input divider. Updated Table 209: Offset computation versus data resolution, Section : 16-bit and 8-bit signed format management: RSHIFTx,SSATE and Table 213: Analog watchdog 1,2,3 comparison. Removed reference to ALIGN bit in the note related to data alignment in Section : Single ADC operating modes support when oversampling. Updated Section 25.6.3: ADC control register (ADC_CR) to distinguish between revision Y with one BOOST bit an revision V with two BOOST bits. Updated Section 25.6.4: ADC configuration register (ADC_CFGR) to change RES[2:0] value corresponding to 8-bit format.</p> <p>Section 29: Operational amplifiers (OPAMP) Removed references to OPAMODE in Section 29.6.1: OPAMP1 control/status register (OPAMP1_CSR). Changed OPAMODE bitfield to reserved in Section 29.6.1: OPAMP1 control/status register (OPAMP1_CSR).</p> <p>Section 32: LCD-TFT display controller (LTDC) Section 32.4.1: LTDC global configuration parameters / Synchronous timing updated.</p> <p>Section 33: JPEG codec (JPEG) Table 273: JPEG codec register map and reset values: JPEG_CR: added HPDIE (bit 6) Renamed JPEG_HWCFR1/2 into JPEG_HWCFGR1/2</p> <p>Section 34: True random number generator (RNG) Updated Section 34.2: RNG main features, Section 34.4: RNG interrupts, Section 34.6: RNG entropy source validation and Table 274: RNG internal input/output signals.</p> |

Table 628. Document revision history (continued)

| Date | Revision | Changes |
|-------------|---------------|---|
| 04-Apr-2019 | 6 (continued) | <p>Section 35: Cryptographic processor (CRYP) Section 35.6.21: CRYP context swap GCM-CCM registers (CRYP_CSGCMCCMxR): renamed CRYP_CSGCMCCMxR[31:0] bitfield into CSGCMCCMx[31:0] and updated bitfield description. Section 35.6.22: CRYP context swap GCM registers (CRYP_CSGCMxR): renamed CRYP_CSGCMx[31:0] bitfield into CSGCMx[31:0] and updated bitfield description. Table 291: CRYP register map and reset values: Added bitfield ranges for CRYP_K0LR/RR to CRYP_K3LR/RR. Updated CRYP_IV0LR/RR to CRYP_IV1LR/RR. Renamed CRYP_KxLR bitfields into Kx.</p> <p>Section 36: Hash processor (HASH) Changed CSRn into CSn for all HASH_CRs registers in Table 296: HASH1 register map and reset values.</p> <p>Section 38: Advanced-control timers (TIM1/TIM8) Replaced BKEx, BKPx by BKE, BK2E, BKP, BK2P. Updated Figure 345: Advanced-control timer block diagram and Figure 388: Break and Break2 circuitry overview. Updated Figure 375: Output stage of capture/compare channel (channel 1, idem ch. 2 and 3), Figure 376: Output stage of capture/compare channel (channel 4) and Figure 377: Output stage of capture/compare channel (channel 5, idem ch. 6). Updated TIM1_CCMR1, TIM1_CCMR2, TIM1_CCMR3, TIM1_CCR2, TIM1_CCR4. Added 00010 configuration for TS[4:0] in TIMx_SMCR register. Table 330: TIM8 register map and reset values: extended DMAB bitfield to 32 bits for TIM8_DMAR.</p> <p>Section 39: General-purpose timers (TIM2/TIM3/TIM4/TIM5) Updated Figure 405: General-purpose timer block diagram. Updated Section 39.3.3: Clock selection. Removed all information related to BDTR register and MOE and OSSSI bits.</p> <p>Section 40: General-purpose timers (TIM12/TIM13/TIM14) Updated Figure 454: General-purpose timer block diagram (TIM12).</p> <p>Section 41: General-purpose timers (TIM15/TIM16/TIM17) Updated Figure 480: TIM15 block diagram. Updated Figure 495: Capture/compare channel 1 main circuit? Figure 496: Output stage of capture/compare channel (channel 1) and Figure 497: Output stage of capture/compare channel (channel 2 for TIM15). Updated Section 41.4.13: Using the break function. Removed bit COMDE for TIM16/17. Table 344: TIM16/TIM17 register map and reset values: changed TISEL[3:0] into T11SEL[3:0] for TIM16_TISEL and TIM17_TISEL registers.</p> |

Table 628. Document revision history (continued)

| Date | Revision | Changes |
|-------------|---------------|--|
| 04-Apr-2019 | 6 (continued) | <p>Section 43: Low-power timer (LPTIM) Updated Section 43.4.9: Timeout function. Updated WAVE bit description in Section 43.7.4: LPTIM configuration register (LPTIM_CFGR).</p> <p>Section 47: Inter-integrated circuit (I2C) interface Updated Section 47.3: I2C implementation. Updated Section 47.7.2: I2C control register 2 (I2C_CR2), Section 47.7.3: I2C own address 1 register (I2C_OAR1), and Section 47.7.8: I2C interrupt clear register (I2C_ICR).</p> <p>Section 48: Universal synchronous/asynchronous receiver transmitter (USART/UART) Replaced DSI_NSS by DIS_NSS in USART_CR1. Changed USART_TDR into USART_RDR in Figure 590: Reception using DMA. Updated Section 48.5.4: USART FIFOs and thresholds. Updated RTO bitfield description in Section 48.7.7: USART receiver timeout register (USART_RTOR). Section 48.7.9: USART interrupt and status register [alternate] (USART_ISR): Updated ABRF, IDLE bit descriptions For FIFO disabled only: updated RXNE and ORE bit descriptions Changed NFCF to NECF in Section 48.7.11: USART interrupt flag clear register (USART_ICR). Table 399: USART register map and reset values: USART_CR1: bit 12 changed to M0, bit 7 changed to TXEIE/TXFNFIE, bit 5 changed to RXNEIE/RXFNEIE. USART_ISR: changed TXE bit to TXE/TXFNF and RXNE into RXNE/RXFNE Corrected USART_ISR/TCGBT reset value for FIFO disabled.</p> <p>Section 49: Low-power universal asynchronous receiver transmitter (LPUART) Changed LPUART_TDR into LPUART_RDR in Figure 604: Reception using DMA. Updated Section 48.5.4: USART FIFOs and thresholds. Updated Section 49.5.1: LPUART control register 1 [alternate] (LPUART_CR1). Corrected WUS bitfield length and changed RXFTCFG to TXFTCFG (bit 31 to 29) in Section 49.5.4: LPUART control register 3 (LPUART_CR3). Section 49.5.8: LPUART interrupt and status register [alternate] (LPUART_ISR): Updated IDLE bit descriptions FIFO enabled only: updated reset value Changed NFCF to NECF in Section 49.5.9: LPUART interrupt flag clear register (LPUART_ICR). Table 405: LPUART register map and reset values LPUART_CR1: bit 12 changed to M0, bit 5 changed to RXNEIE/RXFNEIE. LPUART_ISR: changed TXE bit to TXE/TXFNF Corrected LPUART_ISR reset value and bits 7 and 5 names.</p> |

Table 628. Document revision history (continued)

| Date | Revision | Changes |
|-------------|---------------|--|
| 04-Apr-2019 | 6 (continued) | <p>Section 50: Serial peripheral interface (SPI) Table 413: SPI register map and reset values: SPI2S_SR: Changed bit 7 to CRCE. SPI2S_I2SCFGR: added DATFMT (bit 14)</p> <p>Section 54: Management data input/output (MDIOS) In Table 441: MDIOS register map and reset values, for MDIOS_CR register, changed bit 3 to EIE and added DPC (bit 7).</p> <p>Section 55: Secure digital input/output MultiMediaCard interface (SDMMC) Replaced HOLD by DHOLD in the whole document. Updated Figure 702: SDMMC block diagram and Table 446: SDMMC pins. Updated Figure 711: CLKMUX unit. Updated Wait_S in Section : Data path and Table 456: Data path status flags and clear bits. Updated Section 55.5.3: General description. Updated Section : Stream operation and CMD12. Added Section 55.8: SDMMC interrupts. Updated Section 55.9.10: SDMMC data counter register (SDMMC_DCNT), Section 55.9.11: SDMMC status register (SDMMC_STAR) and Section 55.9.15: SDMMC data FIFO registers x (SDMMC_FIFORx). Updated Table 468: SDMMC register map.</p> <p>Section 56: Controller area network with flexible data rate (FDCAN) Updated Section 56.4.7: FDCAN nominal bit timing and prescaler register (FDCAN_NBTP), Section 56.4.12: FDCAN error counter register (FDCAN_ECR), Section 56.4.15: FDCAN interrupt register (FDCAN_IR), Section 56.4.37: FDCAN Tx buffer request pending register (FDCAN_TXBRP) and Section 56.4.64: FDCAN TT trigger select register (FDCAN_TTTS). Updated Table 495: FDCAN register map and reset values. Updated Table 495: FDCAN register map and reset values.</p> <p>Section 58: Ethernet (ETH): media access control (MAC) with DMA controller Added Figure 789: Supported PHY interfaces. Removed reference to AV standard in Section 58.1: Ethernet introduction.</p> <p>Section 60: Debug infrastructure Changed ETF RAM size to 4 Kbytes in Section 60.5.5: Embedded trace FIFO (ETF) and Section : ETF RAM size register (ETF_RSZ). Added revision V and updated reset value in Section : DBGMCU identity code register (DBGMCU_IDC). Renamed WDGLSD1 into DBG_IWDG1 in Section : DBGMCU APB4 peripheral freeze register (DBGMCU_APB4FZ1). Prefixed all bits names in Section : DBGMCU APB1L peripheral freeze register (DBGMCU_APB1LFZ1), Section : DBGMCU APB2 peripheral freeze register (DBGMCU_APB2FZ1) and Section : DBGMCU APB4 peripheral freeze register (DBGMCU_APB4FZ1) by 'DBG_'.</p> |

Table 628. Document revision history (continued)

| Date | Revision | Changes |
|-------------|----------|--|
| 25-Feb-2020 | 7 | <p>Added RAMECC1/2/3 boundary addresses in <i>Section Table 12.: Register boundary addresses STM32H7-Shark</i>. Updated <i>Section : Error code correction (ECC)</i> and <i>Section : Embedded bootloader</i>. Added <i>Section 3: RAM ECC monitoring (RAMECC)</i></p> <p>Section 4: Embedded flash memory (FLASH) Restricted <i>Table 26</i> to STM32H745xL/747xL/755xL/757xL and added <i>Table 28: Flash memory organization on STM32H745xG/STM32H747xG devices</i>. Added VOS0 range to <i>Table 34: FLASH recommended number of wait states and programming delay</i>. Added VOS0 range to <i>Table 34: FLASH recommended number of wait states and programming delay</i>. Added CRCRDERRIE1/2 in FLASH_CR1/2 registers, together with <i>Section 4.7.10: CRC read error (CRCRDERR)</i>.</p> <p>Section 5: Secure memory management (SMM) (former Secure internal Flash memory) Updated <i>exitSecureArea</i> in <i>Section 5.4.2: Secure area exiting service</i>.</p> <p>Section 27: Power control (PWR) Moved LSI from backup to VDD domain in <i>Figure 169: Power supply overview</i>. Added <i>Figure 181: Switching VCORE from VOS1 to VOS0</i> in <i>Section : VOS0 activation/deactivation sequence</i>. Updated list of GPIOs which use is restricted in <i>Section 15.4.4: Backup domain</i>. Updated ACTVOSRDY bit definition in <i>Section 27.8.2: PWR control status register 1 (PWR_CSR1)</i>. Updated VOSRDY bit definition in <i>Section 27.8.6: PWR D3 domain control register (PWR_D3CR)</i>.</p> <p>Section 7: Low-power SRD domain application example Replaced LINUART1 by LPUART1. Updated <i>Figure 41: Timing diagram of SRD SRAM-to-LPUART1 transfer with BDMA2 and SRD domain in Autonomous mode</i>. Updated <i>Section : EXTI programming</i>. Updated DMAMUX2_C0CR value for DMAMUX2 SYNC0 in <i>Table 48: BDMA2 and DMAMUX2 initialization sequence (DMAMUX2_INIT)</i>. Renamed <i>Table 50</i> into "LPUART1 start programming".</p> <p>Section 49: Reset and Clock Control (RCC) Renamed <i>adc_ker_ck</i> into <i>adc_ker_ck_inputs</i>. Added note on RTC/AWU and updated USB1ULPI and ADC1/2/3 maximum allowed frequencies for VOS0/1/2/3 in <i>Table 345: Kernel clock distribution overview</i>.</p> <p>Section 12: Clock recovery system (CRS) Added <i>Section 12.3: CRS implementation</i>. Updated <i>Section 12.7.1: CRS control register (CRS_CR)</i>. Updated <i>Table 125: CRS register map and reset values</i>.</p> <p>Section 8: General-purpose I/Os (GPIO) In <i>Section 8: General-purpose I/Os (GPIO)</i> changed to analog the mode in which most of the I/O ports are configured during and just after reset.</p> |

Table 628. Document revision history (continued)

| Date | Revision | Changes |
|-------------|---------------|---|
| 25-Feb-2020 | 7 (continued) | <p>Section 16: Direct memory access controller (DMA) Change Bit 20 to TRBUFF instead of reserved in <i>Section 16.5.5: DMA stream x configuration register (DMA_SxCR)</i>.</p> <p>Section 23: Flexible memory controller (FMC) Updated <i>Section : General transaction rules</i> to clarify the behavior of the FMC when AXI transaction data size is different from the device data width and add the case of unaligned addresses. Replaced FMC_CLK by fmc_ker_ck in the formulas of <i>Section : WAIT management in asynchronous accesses</i>.</p> <p>Section 23: Quad-SPI interface (QUADSPI) Updated <i>Section 23.4.4: QUADSPI signal interface protocol modes</i>. Updated <i>Section 23.4.11: QUADSPI configuration</i> and <i>Section 23.6.1: QUADSPI control register (QUADSPI_CR)</i> adding 'when setting QUADSPI interface in DDR mode, the prescaler must be set with a division ratio of 2 or more' paragraph. Updated FTHRES[4:0] bits description of <i>Section 23.6.1: QUADSPI control register (QUADSPI_CR)</i> for IP_XACT compliance. Added note in <i>Section 23.6.6: QUADSPI communication configuration register (QUADSPI_CCR)</i>. Updated <i>Section 23.6.7: QUADSPI address register (QUADSPI_AR)</i>. Changed FLEVEL[6:0] by FLEVEL[5:0] in <i>Section 23.6.18: QUADSPI register map</i>.</p> <p>Section 27: Analog-to-digital converters (ADC) Removed note related to connection to DFSDM limited to ADC1 and ADC2, and added adc_sclk in <i>Figure 155: ADC block diagram</i>. Removed VREF+ and VREF- ranges, and added adc_sclk in <i>Table 201: ADC input/output pins</i>. Updated <i>Section 27.4.3: ADC clocks</i> to distinguish between revision Y and V, and renamed adc_ker_ck into adc_ker_ck_inputs. Updated <i>Section 27.3: ADC implementation</i>. Updated <i>Section : BOOST control</i>. Updated <i>Section 27.4.3: ADC clocks</i> to distinguish between revision Y and V. Updated <i>Section 27.4.12: Channel selection (SQRx, JSQRx)</i>. Updated <i>Section : ADC overrun (OVR, OVRMOD)</i>. Added case of FIFO overflow in <i>Section : Managing a sequence of conversion without using the DMA</i>. Updated <i>Section : Single ADC operating modes support when oversampling</i> to remove the mention that the offset correction is not supported in oversampling mode. <i>Section 27.7.2: ADC x common control register (ADC_CCR)(ADCx_CCR) (x=1/2) (x=1/2 or 3):</i> – Reworded DUAL[4:0] to remove duplicate configurations – Renamed VSENSEEN into TSEN – Updated CKMODE[1:0] bitfield definition to distinguish between revision Y and V. Updated <i>Section 27.6.3: ADC control register (ADC_CR)</i> to distinguish between revision Y and V (one or two BOOST bit(s), respectively).</p> |

Table 628. Document revision history (continued)

| Date | Revision | Changes |
|-------------|---------------|---|
| 25-Feb-2020 | 7 (continued) | <p>Section 27: Analog-to-digital converters (ADC) (continued) Updated RES[2:0] bitfield definition in Section 27.6.4: ADC configuration register (ADC_CFGR). Updated LSHIFT[3:0] corresponding to the “Shift left 14-bits” configuration in Section 27.6.5: ADC configuration register 2 (ADC_CFGR2). Reworded JEXTEN[1:0] to remove duplicate 00 configuration for JEXTEN[1:0] in Section 27.6.16: ADC injected sequence register (ADC_JSQR). Updated Section 27.6.26: ADC calibration factors register (ADC_CALFACT). Removed ADC_CALCLKR register.</p> <p>Section 35: Digital-to-analog converter (DAC) Replaced sample and hold clock (lsi_ck and lse_ck when available) by dac_hold_ck. Updated Section 35.3: DAC implementation. Updated Figure 284: Dual-channel DAC block diagram. Section 35.4.2: DAC pins and internal signals: added DAC interconnection table, changed dac_chx_trg[0:15] into dac_chx_trg[1:15] (trigger 0 corresponds to the SW trigger) in block diagram and Table 128: DAC internal input/output signals. Updated Figure 287: Timing diagram for conversion with trigger disabled TEN = 0 to make it independent from the bus (AHB or APB). Removed Tables Trigger selection from Section 35.4.8: DAC trigger selection Updated Section : Sample and hold mode to indicate that the lsi_ck/lse_ck (when available) must not be stopped when Sample and hold mode enabled. Updated supply voltages in Section 35.4.13: DAC channel buffer calibration. Updated TSELx bitfield description in Section 35.7.1: DAC control register (DAC_CR) register to add the correspondence between TSELx configurations and dac_chx_trgy. Updated CStop mode description for DAC1 in Section 35.5: DAC in low-power modes. Updated Section 35.6: DAC interrupts.</p> <p>Section 33: Comparator (COMP) Removed condition on OR_CFG and changed OR bits to reserved in Section 33.7.3: Comparator option register (COMP_OR).</p> <p>Section 28: Digital filter for sigma delta modulators (DFSDM) Updated Table 206: DFSDM break connection. Removed all “ADC1 and ADC2 only” notes and footnotes. Updated Section 28.7: DFSDM channel y registers (y=0..3), Section 28.7.5: DFSDM channel y data input register (DFSDM_CHyDATINR) and Section 28.8: DFSDM filter x module registers (x=0..1).</p> |

Table 628. Document revision history (continued)

| Date | Revision | Changes |
|-------------|---------------|---|
| 25-Feb-2020 | 7 (continued) | <p>Section 46: JPEG codec (JPEG) Updated Section 46.5.5: JPEG codec configuration register x (JPEG_CONFRx). bit 1 and bit 0 description.</p> <p>Section 48: True random number generator (RNG) Updated Section 48.1: Introduction and Section 48.2: RNG main features. Updated Section 48.3.3: Random number generation and note in Section 48.3.5: RNG operation. Updated Section 48.5: RNG processing time and Section 48.6: RNG entropy source validation. Updated Section 48.7.3: RNG data register (RNG_DR).</p> <p>Section 33: Cryptographic processor (CRYP) Updated number of clock cycles for TDES in Section 33.2: CRYP main features.n Removed flowcharts (Nonuser) in Section 33.4.5: CRYP procedure to perform a cipher operation. Updated Section 33.4.18: CRYP key registers. Section 33.5: CRYP interrupts: removed Figure CRYP interrupt mapping diagram and updated Table 268: CRYP interrupt requests. Section 33.6: CRYP processing time: updated Table 269: Processing latency for ECB, CBC and CTR and Table 270: Processing time (in clock cycle) for GCM and CCM per 128-bit block.</p> <p>Section 51: Hash processor (HASH) Message size changed to $2^{64}-1$ in Section 51.1: Introduction and Section 51.4.3: About secure hash algorithms. Added Section 51.3: HASH implementation. Updated Figure 477: HASH block diagram. Updated Figure 478: Message data swapping feature. Updated Section 51.4.8: HASH suspend/resume operations. Renamed HASH_HRx registers located at address offset 0x0C into Section : HASH aliased digest register x (HASH_HRAx). Updated ALGO description in Section 51.7.1: HASH control register (HASH_CR). Specified value returned by reading Section 51.7.2: HASH data input register (HASH_DIN).</p> <p>Section 23: Advanced-control timers (TIM1) Updated Figure 114: Advanced-control timer block diagram. Updated Section 23.3.3: Repetition counter. Updated Section 23.3.16: Using the break function. Updated Section 23.4.2: TIM1 control register 2 (TIM1_CR2TIMx_CR2)N/A. Aligned TS[2:0] field in Section 23.4.3: TIM1 slave mode control register (TIM1_SMCRTIMx_SMCR)N/A. Updated Section 23.4.5: TIM1 status register (TIM1_SRTIMx_SR)N/A. Updated Section 23.4.6: TIM1 event generation register (TIM1_EGRTIMx_EGR)N/A. Updated Table 176: TIM1 register map and reset values and Table 177: TIM8 register map and reset values. Updated Section 23.3.29: Debug mode.</p> <p>Section 24: General-purpose timer (TIM2) Updated Section 24.4.12: TIM2 counter (TIM2_CNT). Updated Table 173: TIM2 register map and reset values.</p> |

Table 628. Document revision history (continued)

| Date | Revision | Changes |
|-------------|---------------|--|
| 25-Feb-2020 | 7 (continued) | <p>Section 39: General-purpose timers (TIM12/TIM13/TIM14) Updated Figure 412: General-purpose timer block diagram (TIM12) and Figure 426: Capture/compare channel 1 main circuit. Updated Figure 427: Output stage of capture/compare channel (channel 1). Updated Section 39.4.1: TIM12 control register 1 (TIM12_CR1), Section 39.4.5: TIM12 status register (TIM12_SR) and Section 39.5.5: TIMx capture/compare mode register 1 (TIMx_CCMR1)(x = 13 to 14).</p> <p>Section 25: General-purpose timers (TIM16/TIM17) Updated Figure 223: TIM15 block diagram. Updated Figure 237: Capture/compare channel 1 main circuit. Updated: Section 25.5.2: TIM15 control register 2 (TIM15_CR2), Section 25.5.5: TIM15 status register (TIM15_SR), Section 25.5.9: TIM15 capture/compare enable register (TIM15_CCER), Section 25.4.2: TIMx control register 2 (TIMx_CR2)(x = 16 to 17), Section 25.4.4: TIMx status register (TIMx_SR)(x = 16 to 17), Section 25.4.6: TIMx capture/compare mode register 1 (TIMx_CCMR1)(x = 16 to 17) and Section 25.4.8: TIMx capture/compare enable register (TIMx_CCER)(x = 16 to 17). Replaced DT[7:0] by DTG[7:0] in Table 184: TIM15 register map and reset values and Table 183: TIM16/TIM17 register map and reset values.</p> <p>Section 42: Low-power timer (LPTIM) Updated Section 42.4.5: Glitch filter.</p> <p>Section 62: System window watchdog (WWDG) Updated Section 62.6.1: WWDG control register (WWDG_CR).</p> <p>Section 29: Real-time clock (RTC) Updated Figure 286: RTC block diagram and Figure 1327: Tamper detection, Updated Section 29.5: RTC low-power modes. Updated Section 29.6: RTC interrupts.</p> <p>Section 33: Universal synchronous/asynchronous receiver transmitter (USART/UART) Section 33.8.9: USART interrupt and status register (USART_ISR): – FIFO enabled: changed reset value to 0x0X80 00C0 in and Table 235: USART register map and reset values. – FIFO disabled: changed reset value to 0x0000 00C0 in Table 235: USART register map and reset values Section 33.8.12: USART receive data register (USART_RDR): changed reset value to 0x0000 0000. Section 33.8.13: USART transmit data register (USART_TDR): changed reset value to 0x0000 0000. Updated Section 33.8: USART registers to indicate that USART and LPUART registers are accessed by words.</p> |

Table 628. Document revision history (continued)

| Date | Revision | Changes |
|-------------|---------------|---|
| 25-Feb-2020 | 7 (continued) | <p>Section 34: Low-power universal asynchronous receiver transmitter (LPUART) Added Section 34.3: LPUART implementation. Section 34.7.8: LPUART interrupt and status register [alternate] (LPUART_ISR): – FIFO enabled: changed reset value to 0x0080 00C0 in Table 242: LPUART register map and reset values. – FIFO disabled: changed reset value to 0x0000 00C0 in Table 242: LPUART register map and reset values. Updated Section 34.7: LPUART registers to indicate that USART and LPUART registers are accessed by words.</p> <p>Section 69: Serial audio interface (SAI) Figure 833: SAI functional block diagram: number of Dn and CKn lines made generic, added note to indicate that all Dn and CKn might not be available on all SAI instances. Added Section 69.3: SAI implementation. Updated Figure 697: SAI input/output pins to indicate the number of Dn/CKn available on each SAI instance. Updated Section 69.6: SAI registers to indicate that SAI registers are accessed by words. Updated Figure 842: Start-up sequence.</p> <p>Section 58: Single wire protocol master interface (SWPMI) Updated Table 431: SWPMI input/output signals connected to package pins or balls.</p> <p>Section 71: Controller area network with flexible data rate (FDCAN) Updated Section 71.1: Introduction, Software initialization, CAN FD operation, Transceiver delay compensation, Acceptance filter, Section 71.4.4: Bit timing, Section 71.4.6: Application, Clock calibration active and Timing of interface signals. Updated Table 701: Standard message ID filter element, Table 703: Extended message ID filter element, Table 706: Trigger memory element description. Updated Table 936: Standard message ID filter path and Table 937: Extended message ID filter path. Updated Section 71.5.6: FDCAN CC control register (FDCAN_CCCR), Section 71.5.15: FDCAN interrupt register (FDCAN_IR), Section 71.5.18: FDCAN interrupt line enable register (FDCAN_ILE), Section 71.5.21: FDCAN extended ID filter configuration register (FDCAN_XIDFC) and Section 71.6.6: FDCAN TT operation control register (FDCAN_TTOCN). Updated Table 709: CCU register map and reset values.</p> |

Table 628. Document revision history (continued)

| Date | Revision | Changes |
|-------------|---------------|--|
| 25-Feb-2020 | 7 (continued) | <p>Section 72: USB on-the-go full-speed (OTG_FS) Updated Section 72.2: OTG_FS main features, Section 72.15.2: OTG interrupt register (OTG_GOTGINT), Section 72.15.5: OTG reset register (OTG_GRSTCTL), Section 72.15.6: OTG core interrupt register (OTG_GINTSTS), , Section 72.15.18: OTG host periodic transmit FIFO size register (OTG_HPTXFSIZ), Section 72.15.22: OTG host frame interval register (OTG_HFIR), Section 72.15.31: OTG host channel x transfer size register (OTG_HCTSIZx), Section 72.15.33: OTG device configuration register (OTG_DCFG), Section 72.15.34: OTG device control register (OTG_DCTL), Section 72.15.35: OTG device status register (OTG_DSTS), Section 72.15.36: OTG device IN endpoint common interrupt mask register (OTG_DIEPMSK), Section 72.15.37: OTG device OUT endpoint common interrupt mask register (OTG_DOEPMSK), Section 72.15.44: OTG device IN endpoint x control register (OTG_DIEPCTLx) and Section 72.15.50: OTG device OUT endpoint x interrupt register (OTG_DOEPINTx). Updated Section 72.10: OTG_FS Dynamic update of the OTG_HFIR register. Updated Section 72.16.3: Device initialization.</p> <p>Section 75: Ethernet (ETH): gigabit media access control (GMAC) with DMA controller Replaced ptp_pps_o internal signal by eth_ptp_pps_out, and ptp_aux_ts_trig_i by eth_ptp_trgx (where x = 0 to 3) and ptp_aux_trig_i[x] by eth_ptp_trgx. Update ARPEN bit description in Section : Operating mode configuration register (ETH_MACCCR). Reintroduced EIPG enumerated values in Section : Extended operating mode configuration register (ETH_MACECR). Removed sentence “This register is present only when the IEEE 1588 Timestamp feature is selected without external timestamp input” from Section : System time nanoseconds register (ETH_MACSTNR), Section : System time seconds update register (ETH_MACSTSUR) and Section : System time nanoseconds update register (ETH_MACSTNUR) register description.</p> |

Table 628. Document revision history (continued)

| Date | Revision | Changes |
|-------------|---------------|--|
| 25-Feb-2020 | 7 (continued) | <p>Section 60: Debug infrastructure</p> <p>Updated <i>Figure 859: Block diagram of debug infrastructure</i>, <i>Figure 860: Power domains of debug infrastructure</i> and <i>Figure 861: Clock domains of debug infrastructure</i>.</p> <p>Updated <i>Clock domains</i>.</p> <p>Changed ID code for Instruction register = 1110 in <i>Table 585: JTAG-DP data registers</i>.</p> <p>Updated notes in <i>Table 586: Debug port registers</i>.</p> <p>Modified <i>Debug port target identification register (DP_TARGETID)</i> reset value as well as bit descriptions.</p> <p>Modified <i>Access port identification register (AP_IDR)</i> reset value as well as description of REVISION bitfield.</p> <p>Updated <i>Table 588: System ROM table 1</i>.</p> <p>Modified <i>SYSROM CoreSight peripheral identity register 0 (SYSROM_PIDR0)</i>, <i>SYSROM CoreSight peripheral identity register 1 (SYSROM_PIDR1)</i> and <i>SYSROM CoreSight peripheral identity register 2 (SYSROM_PIDR2)</i>.</p> <p>Added <i>Table 589: System ROM table 2</i>.</p> <p>Modified <i>CTI CoreSight peripheral identity register 0 (CTI_PIDR0)</i> and <i>CTI CoreSight peripheral identity register 2 (CTI_PIDR2)</i>.</p> <p>Updated bitfield description for <i>CTI application trigger set register (CTI_APPSET)</i>, <i>CTI application trigger clear register (CTI_APPCLEAR)</i>, <i>CTI application pulse register (CTI_APPPULSE)</i>, <i>CTI trigger IN x enable register (CTI_INENx)</i>, <i>CTI trigger OUT x enable register (CTI_OUTENx)</i> and <i>CTI channel gate register (CTI_GATE)</i>.</p> <p>Updated <i>ETF CoreSight peripheral identity register 2 (ETF_PIDR2)</i> reset value.</p> <p>Modified <i>TPIU CoreSight peripheral identity register 2 (TPIU_PIDR2)</i>, <i>TPIU CoreSight peripheral identity register 2 (TPIU_PIDR2)</i> and <i>SWTF CoreSight peripheral identity register 2 (SWTF_PIDR2)</i>.</p> <p>Changed <i>DBGSTBY_D3</i> and <i>DBGSTOP_D3</i> to reserved in <i>DBGMCU configuration register (DBGMCU_CR)</i>.</p> <p>Updated <i>Table 606: Cortex-M7 processor ROM table</i>.</p> <p>Updated <i>Processor ROM CoreSight peripheral identity register 0 (M7_CPUROM_PIDR0)</i>, <i>Processor ROM CoreSight peripheral identity register 1 (M7_CPUROM_PIDR1)</i> and <i>Processor ROM CoreSight peripheral identity register 2 (M7_CPUROM_PIDR2)</i>.</p> <p>Updated <i>DWT CoreSight peripheral identity register 0 (M7_DWT_PIDR0)</i>, <i>DWT CoreSight peripheral identity register 1 (M7_DWT_PIDR1)</i>, <i>DWT CoreSight peripheral identity register 2 (M7_DWT_PIDR2)</i> reset value.</p> <p>Updated <i>ITM CoreSight peripheral identity register 0 (M7_ITM_PIDR0)</i>, <i>ITM CoreSight peripheral identity register 1 (M7_ITM_PIDR1)</i>, <i>ITM CoreSight peripheral identity register 2 (M7_ITM_PIDR2)</i>.</p> <p>Updated <i>Table 613: Cortex-M7 ETM register map and reset values</i>.</p> |

Table 628. Document revision history (continued)

| Date | Revision | Changes |
|-------------|----------|--|
| 19-Jan-2023 | 8 | <p>Updated Introduction Added errata sheet in the list of reference documents in Section : Related documents</p> <p>Section 2: Memory and bus architecture Updated Figure 1: System architecture for STM32H742xx, STM32H743/53xx and STM32H750xB devices. Updated system memory address range in Table 7: Memory map and default device memory area attributes and Table 9: Boot modes of Section 2.6: Boot configuration. Updated D2 domain information in Section 2.4: Embedded SRAM Section 3: RAM ECC monitoring (RAMECC) Added note to Section 3.1: Introduction</p> <p>Section 4: Embedded flash memory (FLASH) Section : Erase operation overview: added note related to the case where data cache is enabled after erase operations. removed the mention that Bank 2 can be erased with ST secure firmware. Removed bootloader extension from Figure 8: Embedded flash memory usage. Replaced 02 and 03 respectively with 10 and 11 in the description of BOR_LEV bits in Section 4.9.8: FLASH option status register (FLASH_OPTSR_CUR) Added note providing non-secure Flash area start address in SEC_AREA_END1 of Section 4.9.13: FLASH secure address for bank 1 (FLASH_SCAR_CUR1). Added formula to deduce bank 1/2 fail address from FAIL_ECC_ADDR1/2 in Section 4.9.23: FLASH ECC fail address for bank 1 (FLASH_ECC_FA1R) and Section 4.9.37: FLASH ECC fail address for bank 2 (FLASH_ECC_FA2R), respectively. Replaced ST_RAM_SIZE=00 with ST_RAM_SIZE in Section 4.4.6: Description of data protection option bytes. Updated Table 21: Option byte organization: – Modified ST_RAM_SIZE default factory – Modified FLASH_OPTSR[28:27] default factory values</p> <p>Added area of option bytes (bank 1) in Table 15: Flash memory organization on STM32H742xI/743xI/753xI devices, Table 15: Flash memory organization on STM32H742xI/743xI/753xI devices and Table 16: Flash memory organization on STM32H742xG/743xG devices Modified number of wait states in description of LATENCY bits in Section 4.9.1: FLASH access control register (FLASH_ACR) Replaced 2.5V with 2.7V in bit 29 description in Section 4.9.8: FLASH option status register (FLASH_OPTSR_CUR) and Section 4.9.9: FLASH option status register (FLASH_OPTSR_PRG)</p> <p>Section 5: Secure memory management (SMM) Updated Section 5.4.2: Secure area exiting service (modified information on Prototype and Arguments for exitSecureArea section)</p> |

Table 628. Document revision history (continued)

| Date | Revision | Changes |
|-------------|---------------|---|
| 19-Jan-2023 | 8 (continued) | <p>Section 6: Power control (PWR) Updated case of VDD supplied in Bypass mode in Section 6.4.1: System supply startup. Added note below Figure 22: Device startup with VCORE supplied in Bypass mode from external regulator Distinguished reset values for device revision Y and V in PWR control register 3 (PWR_CR3). Updated Figure 22: Device startup with VCORE supplied in Bypass mode from external regulator Replaced WKUPn+1 with WKUPn, WKUPCn+1 with WKUPCn and WKUPFn+1 with WKUPFn in Section 6.8.7: PWR wakeup clear register (PWR_WKUPCR), Section 6.8.8: PWR wakeup flag register (PWR_WKUPFR) and Section 6.8.9: PWR wakeup enable and polarity register (PWR_WKUPEPR)</p> <p>Section 8: Reset and Clock Control (RCC) Updated ADC1,2, 3 maximum allowed frequency and TIM[8:1][17:12] (VOS0) in Table 60: Kernel clock distribution overview. Modified Section : PLL initialization phase description and description of FRACN3[12:0] bits in Section 8.5.5: PLL description Updated FRACN1[12:0] bits in Section 8.7.14: RCC PLL1 fractional divider register (RCC_PLL1FRACR) Section 8.7.36: RCC APB4 peripheral reset register (RCC_APB4RSTR) and Section 8.7.48: RCC APB4 clock register (RCC_APB4ENR): replaced VREF with VREFBUF Replaced VOS2 with VOS3 in Table 60: Kernel clock distribution overview Updated maximum VCO frequency in PLLxVCOSEL of RCC PLL configuration register (RCC_PLLCFGR) and Figure 47: PLL block diagram. Modified Section 8.7.41: RCC AHB1 clock register (RCC_AHB1ENR): modified position of USB2OTGHSULPIEN bit (bit 28 instead of bit 18) Added note to USB2OTGHSULPILPEN in RCC AHB1 Sleep clock register (RCC_AHB1LPENR). Added Clock switching state after system reset in Section 8.5.10: Peripheral allocation Modified maximum allowed frequency for ADC1, 2, 3 in Table 60: Kernel clock distribution overview Updated Figure 58 (added information for rev V devices)</p> |

Table 628. Document revision history (continued)

| Date | Revision | Changes |
|-------------|---------------|--|
| 19-Jan-2023 | 8 (continued) | <p>Section 9: Clock recovery system (CRS) Updated Section 9.8.1: CRS control register (CRS_CR). Updated Section Figure 65.: CRS block diagram.</p> <p>Section 10: Hardware semaphore (HSEM) Updated Section 10.1: Introduction Updated sections 10.3.3 HSEM lock procedures to 10.3.8 and sections 10.4.1 to 10.4.6. Updated Table 90: HSEM internal input/output signals and Table 92: HSEM register map and reset values. Updated Figure 68: Procedure state diagram</p> <p>Section 12: System configuration controller (SYSCFG) In Section 12.3.1: SYSCFG peripheral mode configuration register (SYSCFG_PMCR): – Added note indicating that SYSCFG peripheral mode configuration register (SYSCFG_PMCR) depends on the package, – Modified BOOSTVDDSEL bit description in (V_{DDA} instead of V_{DD}). – Updated SYSCFG_PMCR, PA0SO and PA1SO reset value in Table 95: SYSCFG register map and reset values. Added PI[x] pin in Section 12.3.5: SYSCFG external interrupt configuration register 4 (SYSCFG_EXTICR4)</p> <p>Section 15: Direct memory access controller (DMA) Slight update in the introduction Formatting adjusted in Table 110: Packing/unpacking and endian behavior (bit PINC = MINC = 1)</p> <p>Section 17: DMA request multiplexer (DMAMUX) Restored CSOF3 to 6 in Section 17.6.5: DMAMUX1 request line multiplexer interrupt clear flag register (DMAMUX1_CFR) Updated Section 17.4.4: DMAMUX request line multiplexer.</p> <p>Section 18: Chrom-ART Accelerator controller (DMA2D) Updated Section 18.3.2: DMA2D internal signals</p> <p>Section 21: Cyclic redundancy check calculation unit (CRC) Added note in Section : Polynomial programmability to clarify what are even and odd polynomials. Restored REV_OUT and REV_IN[1:0] in CRC_CR register map table. Added CRC register access granularity in Section 21.2: CRC main features and Section 21.4: CRC registers. Updated Figure 96: CRC calculation unit block diagram.</p> |

Table 628. Document revision history (continued)

| Date | Revision | Changes |
|-------------|---------------|--|
| 19-Jan-2023 | 8 (continued) | <p>Section 22: Flexible memory controller (FMC) Corrected formula in TWR[3:0] bitfield of <i>SDRAM Timing registers for SDRAM memory bank x (FMC_SDTRx)</i></p> <p>Section 24: Delay block (DLYB) Updated <i>Section 24.3.4: Delay line length configuration procedure</i>. Updated <i>Section 24.3.5: Output clock phase configuration procedure</i>.</p> <p>Section 23: Quad-SPI interface (QUADSPI) Updated <i>Section : Triggering the start of a command</i></p> <p>Section 25: Analog-to-digital converters (ADC) Updated <i>Section : I/O analog switch voltage booster</i>. Updated note related to adc_sclk in <i>Section 25.4.3: ADC clocks</i>. Updated formula to calculate the temperature in <i>Section : Reading the temperature (Section 25.4.33: Temperature sensor)</i> Updated <i>Section DMA one shot mode</i> to remove the cross-reference to DMA sections and change the DMA interrupt name to transfer complete interrupt. Updated <i>Figure 202: DMA requests in regular simultaneous mode when DAMDF=0b10</i>. Updated <i>Figure 170: Example of overrun (OVRMOD = 0)</i> (8-stage FIFO). Added <i>Section : Constraints between ADC clocks</i> Remove ADC supply requirements from <i>Table 205: ADC input/output pins</i> Updated <i>Figure 170: Example of overrun (OVRMOD = 0)</i>, <i>Figure 176: AUTDLY=1 in auto-injected mode (JAUTO=1)</i>, <i>Figure 185: Regular and injected oversampling modes used simultaneously</i>, and <i>Figure 186: Triggered regular oversampling with injection</i>. Replaced ADCx_CCR with ADCx_CDR (typo, 2 occurrences) in <i>Section : Regular simultaneous mode with independent injected</i></p> <p>Section 26: Digital-to-analog converter (DAC) In TSEL1/2 of DAC_CR register, changed internal trigger signal names from dac_ch1_trigx/dac_ch2_trigx to dac_ch1_trgx/dac_ch2_trgx. Removed DAC acronym in <i>Section 26.4.9: Noise generation</i> and <i>Section 26.4.10: Triangle-wave generation</i>. Updated the way to stop LSI clock in <i>Section : Sample and hold mode/</i>. In all block diagrams, added index 'x' for DAC output pin names. Replaced all occurrences of DAC_OUTx by DACx_OUTy. Replaced all occurrences of DAC_OUT1 by DACx_OUT1 when referring to the DAC output pin in a generic way Changed IP base address to 0x0000 0000 Renamed <i>Section 26.5</i> into <i>DAC in low-power modes</i>. Updated <i>Table 224: DAC features</i> to indicate if VREF+ pin is available or not Updated HFSEL bitfield description in DAC_MCR register. Changed XXXb notation for binary values into 0bXXX In <i>Figure 207: Dual-channel DAC block diagram</i>, change OTRIMx[5:0] into OTRIMx[4:0] (5 trimming bits only).</p> |

Table 628. Document revision history (continued)

| Date | Revision | Changes |
|-------------|---------------|--|
| 19-Jan-2023 | 8 (continued) | <p>Section 27: Voltage reference buffer (VREFBUF) Fixed VEREFUBUF spelling issue in Section 27.2: VREFBUF functional description Updated VRS in Section 27.3.1: VREFBUF control and status register (VREFBUF_CSR). Updated TRIM in Section 27.3.2: VREFBUF calibration control register (VREFBUF_CCR) Reworded notes related to trimming performed by the user application in Section 27.3.2. Updated Hold mode in Section Table 233.: VREF buffer modes.</p> <p>Section 28: Comparator (COMP) Section 28.7.2: Comparator interrupt clear flag register (COMP_ICFR): changed CC2IF/CC1IF access type to rc_w1 and updated address offset to 0x04.</p> <p>Section 29: Operational amplifiers (OPAMP) Updated Section 29.2: OPAMP main features</p> <p>Section 30: Digital filter for sigma delta modulators (DFSDM) Removed indication of ID registers support in Section 30.3: DFSDM implementation.</p> <p>Section 32: LCD-TFT display controller (LTDC) Updated Figure 245: LTDC block diagram, Section 32.3.2: LTDC pins and internal signals created and Figure 247: Layer window programmable parameters</p> <p>Section 33: JPEG codec (JPEG) Updated several registers, starting from Section 33.5.11: JPEG quantization memory x (JPEG_QMEMx_y)</p> <p>Section 34: True random number generator (RNG) Updated Section 34.3.7: Error management, Section 34.3.8: In this case application must clear the SEIS bit interrupt flag. RNG low-power use and Section 34.7.1: RNG control register (RNG_CR)</p> <p>Section 35: Cryptographic processor (CRYP) Removed reference to STM32 cryptographic library from Section 35.1: Introduction. Support for single and burst transfers updated in Section 35.2: CRYP main features. Added Section 35.3: CRYP implementation. Extended <code>cryp_out_dma</code>, Section : DES/TDES keying and chaining modes and transfer size in Table 292: Cryptographic processor configuration for memory-to-peripheral DMA transfers and Table 293: Cryptographic processor configuration for peripheral-to-memory DMA transfers and <code>CRYP_K0LR/K0RR</code>, both to DES and TDES. Updated Section 35.5: CRYP interrupts. Changed DES to DES/TDES in <code>CRYP_K1LR/K1RR</code>, and DES to TDES in <code>CRYP_K2LR/K2RR</code> and <code>CRYP_K3LR/K3RR</code></p> |

Table 628. Document revision history (continued)

| Date | Revision | Changes |
|-------------|---------------|---|
| 19-Jan-2023 | 8 (continued) | <p>Section 38: Advanced-control timers (TIM1/TIM8) Updated Figure 395: Retriggerable one pulse mode. Updated OC1M[3:0] and OC1PE in Section 38.4.8: TIMx capture/compare mode register 1 [alternate] (TIMx_CCMR1)(x = 1, 8) Updated Figure 367: Control circuit in normal mode, internal clock divided by 1. Updated Figure 344: Advanced-control timer block diagram. Replaced “AFIO controller” by “GPIO alternate function registers”. Updated TIM1_OR1. Updated Figure 366: TIM1/TIM8 ETR input circuitry. Updated Figure 371: Control circuit in external clock mode 2. Updated Section 38.4.20: TIMx break and dead-time register (TIMx_BDTR)(x = 1, 8). Updated BKINP, BK2INP, BKCMP1P, BKCMP2P bit description. Replaced ECC error by Double ECC error when applicable, including in Figure 387: Break and Break2 circuitry overview. Updated Section 38.3.16: Using the break function. Updated Section 38.3.18: Clearing the OCxREF signal on an external event. Updated Section 38.3.26: Timer synchronization. Updated Figure 373: Capture/compare channel 1 main circuit. Updated Section 38.3.21: Retriggerable one pulse mode title. Updated Section 38.4.1: TIMx control register 1 (TIMx_CR1)(x = 1, 8). Updated Section 38.4.2: TIMx control register 2 (TIMx_CR2)(x = 1, 8). Updated Section 38.4.3: TIMx slave mode control register (TIMx_SMCR)(x = 1, 8). Updated Section 38.4.7: TIMx capture/compare mode register 1(TIMx_CCMR1)(x = 1, 8). Updated Section 38.4.8: TIMx capture/compare mode register 1 [alternate] (TIMx_CCMR1)(x = 1, 8). Updated Table 334: Output control bits for complementary OCx and OCxN channels with break feature.</p> <p>Section 39: General-purpose timers (TIM2/TIM3/TIM4/TIM5) Updated Figure 404: General-purpose timer block diagram. Updated Figure 430: Capture/Compare channel 1 main circuit. Updated Figure 431: Output stage of Capture/Compare channel (channel 1). Updated Section 39.3.14: Retriggerable one pulse mode title. Updated Section 39.4.2: TIMx control register 2 (TIMx_CR2)(x = 2 to 5). Updated Section 39.4.8: TIMx capture/compare mode register 1 [alternate] (TIMx_CCMR1) (x = 2 to 5). Updated Table 339: Output control bit for standard OCx channels</p> |

Table 628. Document revision history (continued)

| Date | Revision | Changes |
|-------------|---------------|--|
| 19-Jan-2023 | 8 (continued) | <p>Updated Section 39.3.19: Timer synchronization. Added Figure 448: Master/slave connection example with 1 channel only timers. Updated note below Figure 448: Master/slave connection example with 1 channel only timers Updated Figure 428: Control circuit in external clock mode 2 Replaced “GPIO and AFIO” by “GPIO control and alternate function registers”. Deleted Note in bitfield OC1PE of Section 39.3.8: Output compare mode. Updated title of Figure 417: Counter timing diagram, Update event. Updated Section 39.3.12: Clearing the OCxREF signal on an external event. Updated Figure 440: Retriggerable one-pulse mode.</p> <p>Section 40: General-purpose timers (TIM12/TIM13/TIM14) Updated Figure 455: General-purpose timer block diagram (TIM13/TIM14). Updated Figure 466: Control circuit in external clock mode 1. Updated Figure 468: Capture/compare channel 1 main circuit. Updated Figure 469: Output stage of capture/compare channel (channel 1). Updated Section 40.3.6: PWM input mode (only for TIM12). updated Section 40.3.12: Retriggerable one pulse mode (TIM12 only) title. Added Section 40.3.18: Using timer output as trigger for other timers (TIM13/TIM14). Updated Section 40.4.2: TIM12 control register 2 (TIM12_CR2). Updated Section 40.4.8: TIM12 capture/compare mode register 1 [alternate] (TIM12_CCMR1). Updated Table 342: Output control bit for standard OCx channels. Updated Section 40.5.6: TIMx capture/compare mode register 1 [alternate] (TIMx_CCMR1)(x = 13 to 14). Updated Table 344: Output control bit for standard OCx channels. Updated Figure 475: Retriggerable one pulse mode.</p> <p>Section 41: General-purpose timers (TIM15/TIM16/TIM17) Updated Figure 495: Capture/compare channel 1 main circuit. Updated Figure 496: Output stage of capture/compare channel (channel 1). Updated Figure 509: Retriggerable one pulse mode. Updated Figure 491: Control circuit in normal mode, internal clock divided by 1. Added Note in Section 41.4.13: Using the break function. Added Section 41.4.14: 6-step PWM generation. Suppressed CC2DE in Section 41.5.4: TIM15 DMA/interrupt enable register (TIM15_DIER) Updated Section 41.5.8: TIM15 capture/compare mode register 1 [alternate] (TIM15_CCMR1). Updated Section 41.6.7: TIMx capture/compare mode register 1 [alternate] (TIMx_CCMR1)(x = 16 to 17). Replace “AFIO” with reference to GPIO control and/or alternate function registers.</p> |

Table 628. Document revision history (continued)

| Date | Revision | Changes |
|-------------|---------------|--|
| 19-Jan-2023 | 8 (continued) | <p>Updated Figure 481: TIM16/TIM17 block diagram.</p> <p>Updated Figure 497: Output stage of capture/compare channel (channel 2 for TIM15).</p> <p>Updated Figure 347: Output control bits for complementary OCx and OCxN channels with break feature (TIM15).</p> <p>Updated Section 41.4.7: PWM input mode (only for TIM15).</p> <p>Updated Section 41.4.16: Retriggerable one pulse mode (TIM15 only) title.</p> <p>Added Section 41.4.23: Using timer output as trigger for other timers (TIM16/TIM17).</p> <p>Updated Section 41.6.2: TIMx control register 2 (TIMx_CR2)(x = 16 to 17).</p> <p>Updated Section 41.5.7: TIM15 capture/compare mode register 1 (TIM15_CCMR1).</p> <p>Updated Table 350: TIM16/TIM17 register map and reset values</p> <p>Section 43: Low-power timer (LPTIM)</p> <p>Updated Section 43.7: LPTIM registers introduction.</p> <p>Updated Section 43.7.4: LPTIM configuration register (LPTIM_CFGR).</p> <p>Updated Section 43.2: LPTIM main features.</p> <p>Updated Section 43.4.4: LPTIM reset and clocks</p> <p>Added note to Section 43.4.7: Trigger multiplexer.</p> <p>Updated Section 43.4.15: Encoder mode.</p> <p>Updated Section 43.7.1: LPTIM interrupt and status register (LPTIM_ISR).</p> <p>Updated Section 43.7.2: LPTIM interrupt clear register (LPTIM_ICR).</p> <p>Updated Section 43.7.4: LPTIM configuration register (LPTIM_CFGR).</p> <p>Section 44: System window watchdog (WWDG)</p> <p>Updated Section 44.3: WWDG functional description, Section 44.3.4: Controlling the down-counter, Section 44.4: WWDG interrupts, and Section 44.3.4: Controlling the down-counter.</p> <p>Updated Figure 533: Watchdog block diagram.</p> <p>Section 46: Real-time clock (RTC)</p> <p>Updated Section : Alarm output.</p> <p>Updated RTC_TAFCR in Table 380: RTC register map and reset values.</p> <p>Updated Section 46.6.4: RTC initialization and status register (RTC_ISR).</p> |

Table 628. Document revision history (continued)

| Date | Revision | Changes |
|-------------|---------------|---|
| 19-Jan-2023 | 8 (continued) | <p>Section 47: Inter-integrated circuit (I2C) interface Updated Section 47.4.3: I2C clock requirements and I2C timings. Updated Table 388: Examples of timing settings for fI2CCLK = 8 MHz, Table 389: Examples of timing settings for fI2CCLK = 16 MHz, and Table 390: Examples of timing settings for fI2CCLK = 48 MHz Updated Figure 548: Transfer bus diagrams for I2C slave transmitter (mandatory events only), Figure 551: Transfer bus diagrams for I2C slave receiver (mandatory events only), Figure 558: Transfer bus diagrams for I2C master transmitter (mandatory events only), and Figure 561: Transfer bus diagrams for I2C master receiver (mandatory events only). Corrected issue in Section 47.7.1: I2C control register 1 (I2C_CR1). Updated Hardware transfer management.</p> <p>Section 48: Universal synchronous/asynchronous receiver transmitter (USART/UART) Updated PSC bitfield description in USART_GTPR register (alternate descriptions). Updated SBKF bit description in USART_ISR and LPUART_ISR (alternate description). Updated decimal and hexadecimal notation for values in Section : How to derive USARTDIV from USART_BRR register values. Updated Figure 593: RS232 RTS flow control and Figure 594: RS232 CTS flow control to replace RTS and CTS by nRTS and nCTS respectively. Updated EOBF bit description of USART_ISR (EOBIE belongs to USART_CR1 instead of USART_CR2). Added wakeup from Stop in Section 48.2: USART main features. Added Section 48.4: USART implementation and Section 49.5: LPUART in low-power modes. Updated Section 48.7: USART interrupts and Section 49.6: LPUART interrupts. Updated ABRRQ bit description in USART_RQR register. Updated ABRE bit description in USART_ISR and LPUART_ISR registers (ABRRQ bit belongs to USART_RQR instead of USART_CR3). Replaced all occurrences of 32,768 KHz by 32.768 kHz and baud/s by baud. Corrected baud to bit in Section : Selecting the clock source. Replaced KBps by kbaud and Bps by baud. Replaced a few occurrences of USART in LPUART section. Updated Table 408: Error calculation for programmed baud rates at lpuart_ker_ck_pres = 32.768 kHz Replaced 88.36 Kaud by 88.36 kbaud in the example provided in Section : Determining the maximum LPUART baud rate that enables to correctly wake up the MCU from low-power mode. Renamed SCLK pin to CK in the whole document. Section 48.5.21: USART low-power management and Section 49.4.14: LPUART low-power management: removed mention that usart_wkup/lpuart_wkup interrupt is not mandatory when wakeup event is detected. Updated ADD[7:0] bitfield descriptions in USART_CR2 and LPUART_CR2. Replaced nCTS and nRTS by CTS and RTS in the whole document. Changed YES and NO into Yes and No, respectively, for consistency with other IP user specifications. Replaced LPUART_CR3 by USART_CR3 in ORE bit description of USART_ISR alternate register.</p> |

Table 628. Document revision history (continued)

| Date | Revision | Changes |
|-------------|---------------|---|
| 19-Jan-2023 | 8 (continued) | <p>Added DIS_NSS bit description in USART_CR2. Removed useless uppercase first letters in USART register descriptions. Updated link to section explaining how to configure the DMA register in USART/LPUART character transmission/reception sections.</p> <p>Section 51: Serial audio interface (SAI) Changed table titles into SAI features in Section 51.3: SAI implementation In Section 51.4.12: SPDIF output, replaced $F_{SAI_CK_x}$ by $F_{sai_x_ker_ck}$ in the formula enabling to compute the bit rate. Added reference to implementation section in Section 51.4.10: PDM interface. Added note related to bitfield usage depending on Dx line availability in SAI_PDMDLY. Added note 2 in Table 429: TDM frame configuration examples Changed note (1) to (2) in Figure 654: Detailed PDM interface block diagram.</p> <p>Section 52: SPDIF receiver interface (SPDIFRX) Added note about RCC capabilities in: – Section 52.2: SPDIFRX main features – Table 438: Minimum spdifrx_ker_ck frequency versus audio sampling rate Updated: - Section 52.3: SPDIFRX functional description - Figure 668: SPDIFRX block diagram Figure 673: SPDIFRX decoder Figure 674: Noise filtering and edge detection - Section 52.5.1: SPDIFRX control register (SPDIFRX_CR) Added SPDIFRX prefix on all register titles</p> <p>Section 55: Secure digital input/output MultiMediaCard interface (SDMMC) Updated Section : Data path. Updated Section : Data FIFO. Updated DBLOCKSIZE[3:0] in Section 55.10.9: SDMMC data control register (SDMMC_DCTRL). Updated Section : Stream operation and CMD12. Updated Section : Block operation and CMD12. Updated Section : Normal boot operation. Updated Section : Alternative boot operation Added footnote to Table 453: SDMMC operation modes eMMC.</p> |

Table 628. Document revision history (continued)

| Date | Revision | Changes |
|-------------|---------------|--|
| 19-Jan-2023 | 8 (continued) | <p>Section 56: Controller area network with flexible data rate (FDCAN) Added Section 56.5.47: FDCAN register map and Section 56.6: TTCAN registers Updated Section 56.5.7: FDCAN nominal bit timing and prescaler register (FDCAN_NBTP). Corrected markers in Section 56.7: CCU registers. Updated Table 506: FDCAN TT register map and reset values. Updated Operating conditions, Clock calibration bypassed, Software calibration, Clock calibration active and Section 56.7.2: Calibration configuration register (FDCAN_CCU_CCFG). Replaced Host with user Updated Table 505: FDCAN register map and reset values. Updated Section 56.5.3: FDCAN data bit timing and prescaler register (FDCAN_DBTP).</p> <p>Section 58: Ethernet (ETH): media access control (MAC) with DMA controller Table 522: Ethernet peripheral pins: – Added ETH_PPS_OUT output, ETH_REF_CLK input, and CRS_DV input. – Renamed ETH_RDX and ETH_TX port names into ETH_RXD and ETH_TXD, respectively Added mac_speed_o[1:0], clk_ptp_ref_i and eth_ptp_trig[4:1] in Table 523: Ethernet internal input/output signals Updated Section 58.1: Ethernet introduction, Section 58.2: Ethernet main features, Section 58.2.4: DMA block features, Section 58.2.5: Bus interface features Added Section 58.2.1: Standard compliance, Section 58.2.3: Transaction layer (MTL) features.</p> <p>Updated step 9 of DMA reception sequence in Section : DMA reception. Added Section : Priority scheme for Tx DMA and Rx DMA.</p> <p>Updated Section 58.5.3: Packet filtering, Section 58.5.4: IEEE 1588 timestamp support, and Section 58.5.5: Checksum offload engine. Section 58.5.6: TCP segmentation offload: – Added Section : DMA operation with TSO feature – Renamed section Enabling the TSO feature into Section : Building the Descriptor and the packet for the TSO feature and section updated. Updated Section 58.5.7: IPv4 ARP offload, Section 58.5.8: Loopback, Section 58.5.9: Flow control and Section 58.5.10: MAC management counters.</p> <p>Added MDIO Clause 45 in Section : SMA functional overview.</p> <p>Updated Figure 802: RMII block diagram Updated Section : MII management write operations. Section : Preamble suppression, Section : Trailing clocks and back-to-back transactions and Section : Interrupt for MDIO transaction completion. Updated Section 58.6.2: Media independent interface (MII) and Section 58.6.3: Reduced media independent interface (RMII).</p> |

Table 628. Document revision history (continued)

| Date | Revision | Changes |
|-------------|---------------|--|
| 19-Jan-2023 | 8 (continued) | <p>Updated Section 58.7: Ethernet low-power modes.</p> <p>Updated Section 58.9.3: MAC initialization and Section 58.9.5: Stopping and starting transmission. Added Section 58.9.6: Programming guidelines for switching to new descriptor list in RxDMA, Section 58.9.7: Programming guidelines for switching the AHB clock frequency, Section 58.9.10: Programming guidelines for PTP offload feature and Section 58.9.14: Programming guidelines to perform VLAN filtering on the receive.</p> <p>Updated Section 58.9.11: Programming guidelines for Energy Efficient Ethernet (EEE) and Section 58.9.13: Programming guidelines for TSO.</p> <p>Updated Figure 813: Receive normal descriptor (read format) as well as Table 570: RDES0 normal descriptor (read format) and Table 573: RDES3 normal descriptor (read format).</p> <p>Updated Figure 814: Receive normal descriptor (write-back format) as well as Table 577: RDES3 normal descriptor (write-back format).</p> <p>Updated HL or B1L bit in Table 560: TDES2 normal descriptor (read format), Table 561: TDES3 normal descriptor (read format), Table 565: TDES3 normal descriptor (write-back format) and Table 569: TDES3 context descriptor.</p> <p>Updated Table 581: RDES3 context descriptor.</p> <p>Section 58.11.2: Ethernet DMA registers</p> <ul style="list-style-type: none"> – ETH_DMAMR: changed DA bit access type to rw. – ETH_DMACRXIWTR/ETH_DMAC0RXIWTR: added RWTU[1:0] bitfield. – ETH_DMACIER: removed MMCIE/MMCRSIPIS and GPIIS/GPIIE from Figure 816: Generation of ETH_DMAISR flags; updated AIE bit description. – ETH_DMACTDLAR: updated TDESLA description. – ETH_DMAMR: changed PR[2:0] and TXPR access type to rw. – ETH_DMA(i)CCR: updated MSS[13:0] bitfield description. – ETH_DMA(i)TXCR: Updated TSE bit description. – ETH_DMACRXDLAR: updated RDESLA description. – ETH_DMACTDTPR: updated TDT description. – ETH_DMACRXDTPR: updated RDT description. – ETH_DMACTXRLR: updated TDRL description. – ETH_DMACRXRLR: updated RDRL description. – ETH_DMACSR: changed bit 15:10, 8:6 and 2: 0 access type to rc_w1; updated REB, TEB, AIS, CDE and TBU bit descriptions – ETH_DMARxCR: updated RPF and RBSZ[13:0] descriptions. – ETH_DMASBMR reset value updated. |

Table 628. Document revision history (continued)

| Date | Revision | Changes |
|-------------|---------------|--|
| 19-Jan-2023 | 8 (continued) | <p>Section 58.11.3: Ethernet MTL registers</p> <ul style="list-style-type: none"> – ETH_MTLQMR: updated CNTPRST and RAA and DTXSTS bit descriptions – Updated ETH_MTLRXQOMR register – ETH_MTLTXQOMR: updated TXQEN[1:0], updated TQS[2:0] bitfield definition. – Updated ETH_MTLTXQUR and ETH_MTLRXQMPOCR bit access type. – ETH_MTLTXQ(i)DR: updated STXSTSFS[2:0], PTXQ[2:0] and TXSTSFS bitfield descriptions. <p>Section 58.11.4: Ethernet MAC and MMC registers</p> <ul style="list-style-type: none"> – ETH_MACTSCR: moved Table <i>Timestamp snapshot dependency on register bits</i> from ETH_MACTSCR to Section : Clock types; updated TSUPDT and TSINIT bit descriptions. – Updated ETH_MACVR reset value. – Updated ETH_MACCR, ETH_MACHT0R/1R, ETH_MACVTCR, and ETH_MACVHTR, ETH_MACTSSR, ETH_MACTSCR, ETH_MACISR, ETH_MACRXTXSR, ETH_MACL3L4C0R, ETH_MACSSIR, ETH_MACTSAR, ETH_MACPOCR, ETH_MACSPI0R and ETH_MACSPI1R, ETH_MACSTSUR and ETH_MACSTNUR, ETH_MACETR, ETH_MAC1USTCR, ETH_MACL3L4C1R, ETH_MACSTSR, ETH_MACATSNR, ETH_MACTSEACR, and ETH_MACPPSIR, ETH_MACMDIOAR, and ETH_MACAxHR. – ETH_MACLCSR: added LPITCSE bit. – ETH_MACACR: updated ATSENx and ATSFC bit descriptions – ETH_MACECR: updated GPSL[13:0]. – ETH_MACPFR: updated DNTU bit description. – ETH_MACPFR: updated DNTU, IPFE, HPF, HMC and HUC. – ETH_MACIER: updated TSIE and LPIIE bit descriptions. – ETH_MACHWF1R/F2R: updated reset value. – ETH_MACRPAR: updated ARPPA[31:0] bitfield description. – Updated ETH_MACVIR and added alternate register – ETH_MACQTXFCR: updated PT bitfield – ETH_MACPCSR: updated RWKFILTRST, RWKPTR, RWKPF – ETH_MACDR: updated TFCSTS bit description – Added ETH_MACHWF0R/3R registers – Updated ETH_MMC_RX_INTERRUPT, ETH_MMC_TX_INTERRUPT, ETH_MMC_RX_INTERRUPT_MASK and ETH_MMC_TX_INTERRUPT_MASK, ETH_MACTXTSSNR register access types. <p>Section 61: Device electronic signature Updated Section 61.1: Unique device ID register (96 bits)</p> <p>Added Section 62: Important security notice</p> |

IMPORTANT NOTICE – READ CAREFULLY

STMicroelectronics NV and its subsidiaries (“ST”) reserve the right to make changes, corrections, enhancements, modifications, and improvements to ST products and/or to this document at any time without notice. Purchasers should obtain the latest relevant information on ST products before placing orders. ST products are sold pursuant to ST’s terms and conditions of sale in place at the time of order acknowledgment.

Purchasers are solely responsible for the choice, selection, and use of ST products and ST assumes no liability for application assistance or the design of purchasers’ products.

No license, express or implied, to any intellectual property right is granted by ST herein.

Resale of ST products with provisions different from the information set forth herein shall void any warranty granted by ST for such product.

ST and the ST logo are trademarks of ST. For additional information about ST trademarks, refer to www.st.com/trademarks. All other product or service names are the property of their respective owners.

Information in this document supersedes and replaces information previously supplied in any prior versions of this document.
